**Radiation Therapy of Benign Diseases** Stanley E. Order, Sarah S. Donaldson, 2012-12-06 The radiation therapist's primary concern is the treatment of patients with malignant disease. However, there are definite indications for radiation treatment for benign diseases that do not respond to conventional methods of treatment. It may be the treatment of choice in the unusual instance of a life-threatening benign disease that cannot be surgically or medically managed. The present volume by Order and Donaldson represents a major statement on the utilization of radiation techniques in the management of benign disease. The initial report of the Committee on Radiation Treatment of Benign Disease from the Bureau of Radiological Health recommended that consideration be given to the quality of radiation, the total dose, overall time, underlying organs at risk, and shielding factors before the institution of radiation therapy. Infants and children should be treated with ionizing radiation only in very exceptional cases and after careful evaluation of the potential risk compared with the expected benefit. Direct irradiation of the skin areas overlying organs that are particularly prone to late effects such as the thyroid, eye, gonads, bone marrow, and breast should be avoided. Meticulous radiation protection techniques should be used in all instances, and the depth of penetration of the x-ray beam should be chosen in accordance with depth of the pathologic process. **The**

**Radiation Therapy of Benign Diseases** J. L. Meyer, W. Hinkelbein, 2001-07 This volume discusses radiotherapy and its role in the treatment of benign diseases. Its intent is to broaden the application of radiotherapy beyond malignancy to treat a range of clinical concerns from minor skin problems to life-threatening arterial disease. In addition, it aims to encourage medical practitioners to consider the benefits versus the risks of radiotherapy and assess the most modern technology for uses that may benefit the greatest number of patients. The major challenge in this field is to develop new strategies for the controlled use of radiotherapy. This includes the ability to focus and control applications with equipment that can target tissues with high accuracy using new methods of isotopic and external beam introduction. It also means minimizing the risk of uncontrolled radiation exposure by employing minimal doses and the smallest tissue volume required to achieve the desired effect. The *Radiation Therapy of Benign Diseases* features articles written by internationally recognized experts who confront and critically discuss these major issues. It will prove to be an essential and informative read not only for radiation therapists but also for internists, surgeons, ophthalmologists, and biologists interested in this endeavor. **Radiation Therapy of**
