Radioactive Waste Technology A. Alan Moghissi, H. W. Godbee, Sue A. Hobart, 1986 **Nuclear Wastes** National Research Council, Division on Earth and Life Studies, Commission on Geosciences, Environment and Resources, Committee on Separations Technology and Transmutation Systems, 1996-03-23 Disposal of radioactive waste from nuclear weapons production and power generation has caused public outcry and political consternation Nuclear Wastes presents a critical review of some waste management and disposal alternatives to the current national policy of direct disposal of light water reactor spent fuel The book offers clearcut conclusions for what the nation should do today and what solutions should be explored for tomorrow The committee examines the currently used once through fuel cycle versus different alternatives of separations and transmutation technology systems by which hazardous radionuclides are converted to nuclides that are either stable or radioactive with short half lives The volume provides detailed findings and conclusions about the status and feasibility of plutonium extraction and more advanced separations technologies as well as three principal transmutation concepts for commercial reactor spent fuel The book discusses nuclear proliferation the U S nuclear regulatory structure issues of health safety and transportation the proposed sale of electrical energy as a means of paying for the transmutation system and other key issues *Managing the Nation's Commercial High-level Radioactive Waste* United States. Congress. Office of Technology Assessment, 1985 *Hazardous and Radioactive Waste Treatment Technologies Handbook* Chang H. Oh, 2001-06-27 With detailed photos and schematic system diagrams the Hazardous and Radioactive Waste Treatment Technologies Handbook provides the latest information on current technologies in the market Intended as a reference for scientists engineers and engineering students it covers waste related thermal and non thermal technologies separation techniques and stabilization technologies It provides an overview of recent waste technologies for both hazardous chemical wastes and radioactive wastes By implementing the techniques presented in this book readers will be able to decide which appropriate technology to use and how to design the equipment for their particular needs *Technology for Commercial Radioactive Waste Management* United States. Subcommittee on Science, Technology, and Space,1978 Handbook of Advanced Radioactive Waste Conditioning Technologies Michael I. Ojovan,2011-01-24 Radioactive wastes are generated from a wide range of sources including the power industry and medical and scientific research institutions presenting a range of challenges in dealing with a diverse set of radionuclides of varying concentrations Conditioning technologies are essential for the encapsulation and immobilisation of these radioactive wastes forming the initial engineered barrier required for their transportation storage and disposal The need to ensure the long term performance of radioactive waste forms is a key driver of the development of advanced conditioning technologies The Handbook of advanced radioactive waste conditioning technologies provides a comprehensive and systematic reference on the various options available and under development for the treatment and immobilisation of radioactive wastes The book opens with an introductory chapter on radioactive waste characterisation and selection of conditioning technologies Part one reviews the main radioactive waste treatment processes and conditioning technologies including volume reduction techniques such as compaction incineration and plasma treatment as well as encapsulation methods such as cementation calcination and vitrification This coverage is extended in part two with in depth reviews of the development of advanced materials for radioactive waste conditioning including geopolymers glass and ceramic matrices for nuclear waste immobilisation and waste packages and containers for disposal Finally part three reviews the long term performance assessment and knowledge management techniques applicable to both spent nuclear fuels and solid radioactive waste forms With its distinguished international team of contributors the Handbook of advanced radioactive waste conditioning technologies is a standard reference for all radioactive waste management professionals radiochemists academics and researchers involved in the development of the nuclear fuel cycle Provides a comprehensive and systematic reference on the various options available and under development for the treatment and immobilisation of radioactive wastes Explores radioactive waste characterisation and selection of conditioning technologies including the development of advanced materials for radioactive waste conditioning Assesses the main radioactive waste treatment

Radioactive Waste Christian Streffer,Carl Friedrich Gethmann,Georg Kamp,Wolfgang Kröger,Eckard Rehbinder,Ortwin Renn,2011-11-16 Radioactive waste above all highly radioactive wastes from nuclear installations caused by research medicine and technology must be disposed of safely However both the strategies disputed for the disposal of radioactive waste as well as concrete proposals for choosing a location for final waste disposal are highly debatable An appropriate disposal must conform to both complex technical requirements and fulfill the radio biological conditions to appropriately protect man and nature Ethical legal and social conditions must also be considered An interdisciplinary team from various relevant fields compiled the current status quo and developed criteria and strategies which on the one hand meet the requirements of optimal warning and prevention of risk for present and future generations and additionally on the other hand meet the needs of what current society agrees what is expected to be allowed This study can be understood as an advanced and continuing contribution to the corresponding scientific specialized debates due to its interdisciplinary treatment At the same time it serves as a fundamentally informing contribution to public and political debates offering an easily comprehensible executive summary and precise content recommendations **Managing Commercial High-level Radioactive Waste** United States. Congress. Office of Technology Assessment,1982 Radioactive Waste Frans Berkhout,1991 Radioactive Waste provides a detailed historical account of the policy and practice of radwaste management in Britain Sweden and the Federal Republic of Germany In their differing approaches these three countries define the parameters of civil nuclear strategy in Europe The comparative analysis of the evolution of policy clarifies the context of political and technical decision making Assessing the varying degrees of influence which the public the industry and the government exercise over these actions Frans Berkhout applies the concept of boundaries of control questioning the extent to which such control can be relinquished This analysis of nuclear strategy the politics of nuclear power and the shifting emphasis of government regulation redefines the issue of radwaste management and sets it at the centre of the current debate about power the environment and society **The Bedrock of Opinion** Göran Sundqvist,2002-02-28 The issue of nuclear waste is about managing some of the most dangerous material ever to exist This has to be done safely and in a way that remains safe for many thousands of years To realize safe disposal satisfying bedrock conditions are needed as well as people willing to accept disposal in their own community In most countries this kind of place has been difficult to locate This book is the first of its kind reporting a study which analyses in detail the highly controversial decisions on how to finally dispose of nuclear waste in Sweden a country considered a forerunner in nuclear waste management The siting process is

traced as are its connections both back in time and to the global community From the perspective of science and technology studies the study contributes to the understanding of regulation of controversial technical issues in modern societies

Long-term High-level Waste Technology Program, 1980 Nuclear Back-end and Transmutation Technology for Waste Disposal Ken Nakajima, 2014-11-05 This book covers essential aspects of transmutation technologies highlighting especially the advances in Japan The accident at the Fukushima Daiichi Nuclear Power Plant NPP has caused us to focus attention on a large amount of spent nuclear fuels stored in NPPs In addition public anxiety regarding the treatment and disposal of high level radioactive wastes that require long term control is growing The Japanese policy on the back end of the nuclear fuel cycle is still unpredictable in the aftermath of the accident Therefore research and development for enhancing the safety of various processes involved in nuclear energy production are being actively pursued worldwide In particular nuclear transmutation technology has been drawing significant attention after the accident This publication is timely with the following highlights 1 Development of accelerator driven systems ADSs which is a brand new reactor concept for transmutation of highly radioactive wastes 2 Nuclear reactor systems from the point of view of the nuclear fuel cycle How to reduce nuclear wastes or how to treat them including the debris from TEPCO s Fukushima nuclear power stations is discussed and 3 Environmental radioactivity radioactive waste treatment and geological disposal policy State of the art technologies for overall back end issues of the nuclear fuel cycle as well as the technologies of transmutation are presented here The chapter authors are actively involved in the development of ADSs and transmutation related technologies The future of the back end issues in Japan is very uncertain after the accident at the Fukushima Daiichi NPP and this book provides an opportunity for readers to consider the future direction of those issues Nuclear Waste Cleanup Technologies and Opportunities Robert Noyes, 1995-12-31 One of the largest most complicated and expensive environmental problems in the United States is the cleanup of nuclear wastes The US Department of Energy DOE has approximately 4 000 contaminated sites covering tens of thousands of acres and replete with contaminated hazardous or radioactive waste soil or structures In addition to high level waste it has more than 250 000 cubic meters of transuranic waste and millions of cubic meters of low level radio active waste In addition DOE is responsible for thousands of facilities awaiting decontamination decommissioning and dismantling DOE and its predecessors have been involved in the management of radioactive wastes since 1943 when such wastes were first generated in significant quantities as by products of nuclear weapons production Waste connected with DOE s nuclear weapons complex has been accumulating as a result of various operations spanning over five decades The cost estimates for nuclear waste cleanup in the United States have been rapidly rising It has recently been estimated to be in a range from 200 to 350 billion Costs could vary considerably based on future philosophies as to whether to isolate certain sites the iron fence philosophy or clean them up to a pristine condition the greenfields philosophy Funding will also be based on Congressional action that may reduce environmental cleanup based on budget considerations
