Radiofrequency Catheter Ablation For The Treatment Of Cardiac Arrhythmias:

Radiofrequency Catheter Ablation for Cardiac Arrhythmias, 2002 Catheter ablation is a treatment for patients with heart rhythm disturbances cardiac arrhythmias called tachycardias Tachycardias cause symptoms that degrade the quality of life of individuals and are a life long medical problem Some of them are common medical problems such as atrial fibrillation and many begin at a young age with the potential for life long morbidity Certain tachycardias can be life threatening Drug therapy to control these tachycardias is often ineffective or causes intolerable side effects Presently catheter ablation delivered by radiofrequency energy RFA is the predominant procedure used for the treatment of tachycardias and may be curative or palliative This is the first synthesis of research studies and economic evaluations of RFA in Canada For the following conditions RFA is associated with a high procedural success rate and a low rate of complications within two years of follow up a Paroxysmal supraventricular tachycardia PSVT secondary to an accessory pathway b PSVT secondary to atrioventricular node re entry c Atrial flutter d Focal and re entrant atrial tachycardias For the following conditions catheter ablation is still within the research domain a Atrial fibrillation b Ventricular tachycardia VT in the setting of structural heart disease In adult patients with either symptomatic PSVT or VT patients with implantable defibrillators who experience frequent recurrences RFA is both more effective and less costly than drug therapy options For these patients RFA costs within US 21 000 C 33 000 per quality adjusted life year gained For all the different types of ablation procedures there is a paucity of high quality outcome studies comparing ablation with alternative therapies

the cause of significant morbidity and the sudden death of at least 350 000 patients every year in the United States alone At that time the only tools available for analyzing abnormal heart rhythms were the standard EKG machine and careful deductive reasoning During the early 1960s cardiac pacemakers reflected the first foray in the electrical therapy of cardiac arrhythmias Pacemakers were first implanted in order to control syncopal episodes related to bradycardic heart rhythms Although crude and bulky devices their utility was immediately obvious to physicians and patients alike The recognition that electrical signals could be recorded from inside the heart and that the heart s rhythm could be controlled by the application of electrical energy began the era of clinical cardiac electrophysiology which was to follow In the late 1960s and early 1970s and at the peak of the Vietnam conflict a group of cardiologists with special training in cardiac electrophysiology were sequestered at the US Public Health Service Hospital at Staten Island
