Rain shadow. Rain shadows occur where humid winds blowing inland from the ocean meet a mountain range. On the windward (wind-facing) side of the mountains, air rises and cools, and large amounts of water vapor condense to form clouds and precipitation. On the leeward side of the mountains, cold, dry air descends, warms via adiabatic heating, and causes much drier conditions.

Shadows In The Rain:

Rain Shadows Glen Earthsong, AI, 2025-03-10 Rain Shadows explores the fascinating phenomenon where mountain ranges dramatically alter regional climates creating lush environments on one side and arid deserts on the other This occurs through orographic lift where air rises and releases moisture as it crosses mountains The book highlights how mountains act as critical modifiers of climate impacting ecosystems and species distribution Did you know that the Himalayas contribute to the formation of the Gobi Desert or that the Andes play a similar role in creating the Atacama Desert The book progresses from basic meteorological principles and the influence of mountains on wind and precipitation to detailed case studies of prominent rain shadow regions It then examines cutting edge climate modeling to predict future impacts on these areas The text also addresses practical implications for water resource management and agriculture By drawing upon diverse research Rain Shadows offers a holistic understanding of these unique geographies and their challenges emphasizing the importance of these areas in the face of global climate change Shadow Rain 2, true love true enemy Philip Mudin, 2014-03-03
