Nervous System In Arterial Hypertension:

The Nervous System in Arterial Hypertension Stevo Julius, Murray D. Esler, Charles N. Ellis, 1976 Arterial Hypertension J. Rosenthal, 2012-12-06 It has been a little more than half a century since serious organized research on hypertension began Public and even physician interest in the subject remained minimal until the early forties and even then there were not more than a dozen fulltime investigators worldwide The first organization devoted to communicating regularly the results of hypertension research was created in Cleveland in 1945 it became the Council for High Blood Pressure Research of the American Heart Association in 1949 The early history of hypertension is not a story of progressive achievement Richard Bright is given great credit followed by Mahomed Allbutt Riva Rocci Bergman and Janeway but it was not until Volhard Fahr and Allen that some semblance of order emerged They were followed by a younger much more vigorous group of investigators who in fact initiated modern research in hypertension Two more generations have followed In the course of some fifty years we have seen emerge a magnificent body of evidence that has prescribed good treatment and contributed a considerable understanding of the many complex mechanisms involved in the hypertension Treatment is now actively promoted by public health agencies including the World Health Organization This is an other case of treatment preceding full understanding of the nature of the disease Blood Vessel Changes in Hypertension Structure and Function, Volume II R.M.K.W. Lee, 2024-11-01 Written by established researchers this two volume publication provides timely comprehensive and insightful reviews on recent discoveries in the etiology of hypertension Structural changes of the blood vessels in hypertension in relation to connective tissue cerebral vessel structure and innervation smooth muscle cell hypertrophy and or hyperplasia and rarefaction of microvessels are discussed Also presented are the effects of antihypertensive therapy on vessel structure and function A unique feature is the inclusion of a chapter on pulmonary vascular changes in pulmonary hypertension which shows certain changes that are similar to systemic hypertension This book is of major interest to researchers involved in the study of hypertension and the biology of the blood vessels **The Tonus of the Autonomic Nervous System in Arterial Hypertension** ,1931 **Kidney Disease and Nephrology Index** ,1976-07 *Current Bibliography of Epidemiology* ,1972 **Cumulated Index Medicus** ,1968 **Surgery of the Autonomic Nervous System** Jonathan A. Hyam, Erlick A. C. Pereira, Alexander L. Green, 2016-04-14 Autonomic surgery is an important and expanding field within contemporary clinical practice Surgical therapies influencing the autonomic nervous system have historically entailed disabling various components of its network by injurious methods More sophisticated techniques have now emerged to allow modulation of neural function by electrical implants or by preservative surgery This has fuelled the expansion in this field as safer therapies with greater scope for patient benefit have become available As the potential for precise neural manipulation has advanced so has the number and diversity of diseases which have become amenable to such therapies This book reviews the basic science underpinning the autonomic control of various body systems and the state of

the art clinical applications by which these systems are surgically modulated in patients today Clinical chapters include details of the procedure operative considerations outcomes adverse effect profile post operative management of such patients and reflections on personal experience Autonomic surgery can be applied to a wide variety of diseases affecting large numbers of the population such as angina pectoris hypertension orthostatic hypotension sexual dysfunction regional pain syndromes headache and epilepsy

ACE Inhibitors Pedro D'Orléans-Juste,G.E. Plante,2012-12-06 Angiotensin converting enzyme inhibitors ACEI represent the first class of antihypertensive agents that was designed and developed on the basis of a well defined physiopathological axis of arterial hypertension a vascular disorder that is now becoming one of the major causes of morbidity mortality not only in developed societies but also in the highly populated developing countries 1 CAPTOPRIL the prototype of the PRIL family which now comprises more than 40 molecule species was quite hazardous and the clinical development almost failed when serious side effects were reported in an alarmist fashion in reputable scientific journals such as the New England Journal of Medicine and Lancet Squibb Sons came very close to withdrawing CAPTOPRIL from clinical investigation 2 However after re examination of the data obtained from different categories of patients and appropriate dose adjustments the clinical use of CAPTOPRIL turned out to be revolutionary The prototype as well as other members of the PRIL family became the starting point for numerous basic and clinical research programs focusing on the interactions of ACEI with the kinin endothelin and nitric oxide systems and the contribution of the receptors for AT I AT 2 bradykinin Bland B ETA and ET B to the pharmacological actions 2 of the respective peptides This research activity led to the development of new pharmacological agents such as the angiotensin receptor antagonists and more recently the neutral endopeptidase inhibitors In the near future bradykinin receptor antagonists also will be available to modulate ACEI pharmacological actions
