**Psychopathology and Child Development** Eric Schopler, 2012-12-06 The First International Leo Kanner Colloquium on Child Development Deviations and Treatment explores relationships between experimental research normal development and interventions with early infantile autism as a reference model of relatively unambiguous abnormal development Sponsored by the Treatment and Education of Autistic and related Communications handicapped Children TEACCH Project at the University of North Carolina at Chapel Hill the colloquium tackled the challenge of facilitating communications among scientists of different disciplines working in a specialized area The meeting proved successful in generating an interplay and information exchange among scientists of diverse academic and professional orientation who if not completely able to agree on common factors did nevertheless achieve awareness and clarification of their differences The TEACCH conference and this volume have implications for all research efforts within and outside the domain of mental health This is particularly so at a time of limited dollar resources for research support The present and foreseeable future represent such a time one when communication among fields resource competition between basic and applied research biomedical versus psychosocial research and the question of research utilization assume a new commanding significance Thus the question of accountability for research has come to the fore

**Mental Health Interventions with Preschool Children** Robert D. Lyman, Toni L. Hembree-Kigin, 2013-11-11 Preschool children have been largely neglected in the mental health treatment literature although research has established that many behavioral and emotional disorders in children result from events occurring during the preschool years or are first manifested during this

period This has occurred for several reasons Traditional psychoanalytic thinking has considered preschoolers to be too psychologically immature for complete manifestations of psychopathology and the limited language abilities of young children have complicated assessment procedures and made them less appropriate for treatment approaches that are largely verbal in nature In addition the developmental complexity of the preschool period has deterred many researchers from investigating clinical issues with this age group Partly as a result of the lack of information on preschoolers in the literature practitioners have historically been uncomfortable in conducting assessments and initiating treatment with young children They have often adopted a wait and see attitude in which formal mental health diagnosis and treatment are not implemented until after the child's entry into school Unfortunately such a delay may mean wasting the time during which mental health interventions can be maximally effective Recently this attitude has changed and practitioners now recognize the need for assessment and treatment of behavioral and emotional disorders early in life What they require to assist them in the timely delivery of such services is information about assessment and treatment procedures specifically designed for preschoolers and with demonstrated efficacy with that age group
