Reaction Engineering Of Step Growth Polymerization:

Reaction Engineering of Step Growth Polymerization Santosh K. Gupta, Ajit Kumar, 2012-12-06 The literature in polymerization reaction engineering has bloomed sufficiently in the last several years to justify our attempt in putting together this book. Rather than offer a comprehensive treatment of the entire field thereby duplicating earlier texts as well as some ongoing bookwriting efforts, we decided to narrow down our aim to step growth polymerization systems. This not only provides us the luxury of a more elaborate presentation within the constraints of production costs but also enables us to remain on somewhat familiar terrain. The style and format we have selected are those of a textbook. The first six chapters present the principles of step growth polymerization. These are quite general and can easily be applied in such diverse and emerging fields as polymerization applications in photolithography and microelectronics. A detailed discussion of several important step growth polymerizations follows in the next five chapters. One could cover the first six chapters of this book in about six to eight weeks of a three credit graduate course on polymerization reactors with the other chapters assigned for reading. This could be followed by a discussion of chain growth and other polymerizations with which our material blends well. Alternately, the entire contents of this book could be covered in a course on step growth systems alone.

Fundamentals of Polymer Engineering, Revised and Expanded Anil Kumar, Rakesh K. Gupta, 2003-01-21 Exploring the characterization, thermodynamics and structural mechanical, thermal and transport behavior of polymers as melts, solutions and solids, this text covers essential concepts and breakthroughs in reactor design and polymer production and processing. It contains modern theories, end of chapter problems and real world examples for a clear understanding of polymer function and development. *Fundamentals of Polymer Engineering* Second Edition provides a thorough grounding in the fundamentals of polymer science for more advanced study in the field of polymers. Topics include reaction engineering of step growth polymerization, emulsion polymerization and polymer diffusion. *Polymer Reaction Engineering* Jose

Asua, 2008-04-15 Polymers are an example of products by process where the final product properties are mostly determined during manufacture in the reactor. An understanding of processes occurring in the polymerization reactor is therefore crucial to achieving efficient, consistent, safe and environmentally friendly production of polymeric materials. *Polymer Reaction Engineering* provides the link between the fundamentals of polymerization kinetics and polymer microstructure achieved in the reactor. Organized according to the type of polymerization, each chapter starts with a description of the main polymers produced by the particular method, their key microstructural features and their applications. Polymerization kinetics and its effect on reactor configuration, mass and energy balances and scale up are covered in detail. The text is illustrated with examples emphasizing general concepts, principles and methodology. Written as an authoritative guide for chemists and chemical engineers in industry and academia, *Polymer Reaction Engineering* will also be a key reference source for advanced courses in polymer chemistry and technology. **Step-Growth Polymerization Process Modeling and Product Design**

Polymer Reactor Engineering C. McGreavy, 2012-12-06 Approximately half of the world production of the petrochemical industry more than 100 million tonnes is in the form of polymers yet it would probably surprise most people to learn how much their lifestyle

depends on polymers ranging as they do from detergents kitchenware and electrical appliances to furnishings and a myriad other domestic goods Still less are they likely to be aware of the extensive part they play in engineering applications for mechanical machine components and advanced high performance aircraft This versatility derives from the fact that polymeric materials are made up of a range of molecules of varying length whose properties are related to molecular structure and the proportions of the chains in the mixture For example polypropylene is a commodity polymer which is produced in hundreds of different grades to meet specific market requirements This depends on the catalyst as well as the operating conditions and reactor design A major area for growth is in substituting polymers for conventional materials such as ceramics and metals Not only can they match these materials in terms of mechanical strength and robustness but they have very good resistance to chemical attack Polyamides for example are widely used for car bumpers and new polymers are being developed for engine manifolds and covers In 1993 there is typically 100 kg of various polymers used in cars and this is continually increasing giving a net weight reduction and hence better fuel economy
