Microprocessor Design Thomas D. Burd, Robert W. Brodersen, 2012-12-06 This work began in 1995 as an outgrowth of the InfoPad project which showed us that in order to reduce the energy consumption of a portable multimedia terminal that something had to be done about the consumption of the microprocessor subsystem The design of the InfoPad attempted to reduce the requirements of this general purpose processor by moving the computation into the network or by the use of highly optimized integrated circuits but in spite of these efforts it still was a major consumer of energy The reasons for this became apparent as we determined that the energy required to perform a function in dedicated hardware could be several orders of magnitude lower than that consumed in the InfoPad microprocessor We therefore set out on a full fledged attack on all aspects of the microprocessor energy consumption 1 J After considerable analysis it became clear that though better circuit design and a stream lined architecture would assist in our goal of energy reduction that the biggest gains were to be found by operating at reduced voltages For the busses and VO this could be accomplished without significant degradation of the processor performance but this was not a straightforward solution when applied to the core of the processor sub system CPU and memory *Parallel Program Development for Cluster Computing* José Cardoso Cunha, Péter Kacsuk, Stephen

Winter, 2001 The book is divided into two parts the first one covering the concepts and methodologies and the second describing the tools and integrated environments that were developed in those projects In this way we hope that the reader will find the book useful not only concerning an identification of current trends in parallel program development but also concerning their practical illustration through concrete tools and environments **Fundamentals of Information**
