Long-term Consequences of Early Feeding John Boulton, Zvi Laron, Jean Rey, 1996

Protein and Energy Requirements in Infancy and Childhood Jacques Rigo, Ekhard E. Ziegler, 2006-01-01 In this volume world renowned specialists review the latest scientific information and recommendations for protein and energy requirements of infants and children New data obtained with the latest techniques show significantly lower requirements for both energy and protein than previously thought This will have far reaching implications for nutrition and health not only during infancy and childhood but also for long term health outcomes such as obesity and related disorders Indeed for the latest generation of some infant formulas many of the new nutrition concepts presented in this volume especially those concerning protein level and quality have already been translated into clinically tested products that are coming ever closer to the gold standard human milk not only in terms of composition but also of outcome The important public health implications of the information reviewed in this volume provide essential reading for pediatricians clinical investigators and health workers engaged in the prevention of nutrition related disorders

The Window of Opportunity: Pre-Pregnancy to 24 Months of Age D. J. P. Barker, R. L. Bergmann, P. L. Ogra, 2008-07 There is no longer any doubt that the inherited genetic constitution of the individual has a large influence on the entire life cycle from human fetal development and pre and postnatal growth to subsequent health status However growing evidence suggests that this predisposition is not rigid but that early genetic imprinting caused by exposure to a diverse spectrum of nutrients macromolecules microbial agents and other cellular or soluble components present in the external environment is also of importance According to this concept of the developmental origins of adult diseases intrauterine and early life events play an important role in the etiology of human diseases there seems to exist a critical window of opportunity in the human infant before and during pregnancy and up to 24 months of age Altered exposure to different environmental agents during this critical period may determine the nature of responses in the perinatal period and the expression of specific disease states in later life The papers presented in this publication thus focus on the impact of perinatal growth nutrition environmental microflora and host immune responses on the outcome of health and disease in later life

Handbook of dietary and nutritional aspects of bottle feeding Victor R. Preedy, Ronald Ross Watson, Sherma Zibadi, 2023-08-07 Newborn babies are usually fed via the breast which ensures optimal development and emotional mother child bonding However in some circumstances breast feeding may be either inadequate or impractical Historically deficiencies in the provision of breast milk were addressed by wet nurse feeding but this was superseded by the introduction of artificial milk feeds i e formula or bottle feeds This handbook covers formula feeds in the most comprehensive way Each

contribution starts with convenient summary points Six parts give information about historical and international aspects South American African and Chinese perspectives composition microbiological and chemical contaminants allergy and immunology effects on physical development and metabolic responses and effects on psychological and neurodevelopment The Handbook of dietary and nutritional aspects of bottle feeding is essential reading material for nutritionists dieticians paediatricians midwives pharmacologists health care professionals general practitioners and those interested in babies health in general

The influence of maternal, fetal and child nutrition on the development of chronic disease in later life Scientific Advisory Committee on Nutrition,2011-06-23 In this final report on the The influence of maternal fetal and child nutrition on the development of chronic disease in later life the Subgroup on Maternal and Child Nutrition SMCN reviews the evidence that early life nutrition exerts long term effects and influences the risk of chronic disease in adulthood bringing together findings from both observational and experimental studies and considering implications for maternal and child nutrition in the UK SACN concludes that there is cause for concern about the later health consequences of compromised or excessive nutrient supply during early fetal and infant life It notes that in the context of reproduction the impact of current dietary patterns on women and girls is of particular concern and considers that improving the nutritional status of women of childbearing age infants and young children has the potential to improve the health of future generations The Committee also offers recommendations for future research in this area particularly emphasising the need for data which better characterise dietary patterns and patterns of pre and postnatal growth

Leptin and Leptin Antagonists Prof. Arie Gertler, 2009-03-06 The discovery of leptin the obese ob gene product which is not expressed as a functional protein in ob/ob mice focused the scientific community's attention on its role as an anorexic hormone involved in the negative regulation of food intake Almost 14 years after this breakthrough discovery and over 14 000 leptin related publications later leptin is now known to participate in a wide range of biological functions that include in addition to its early envisaged function as an adipostat glucose metabolism glucocorticoid synthesis CD4 T lymphocyte proliferation cytokine secretion phagocytosis hypothalamic pituitary adrenal axis regulation reproduction cardiovascular pathology bone formation apoptosis and angiogenesis In short it is now well documented that leptin acts like a cytokine hormone with many pleiotropic effects Furthermore in recent years it has become more and more apparent that many of leptin's effects are acquired not only through its central action but also through its systemic action on a peripheral level This book focuses mainly on the relatively novel aspects of leptin's actions Leptin's

involvement in early postnatal imprinting has led to new insight into developmental programming This highly novel aspect of leptin's action is reviewed extensively in the final chapter of this book by the Auckland group Vickers Krechowec Gluckman and Breier In the last five years it has been shown that at least in rodents leptin acts as an important neurotrophic factor promoting the early postnatal maturation of neural pathways within the hypothalamus The authors review experimental evidence originating largely from their own work which shows that therapeutic intervention with leptin in the rodents early postnatal life can potentially reverse or substantially ameliorate the consequences of developmental malprogramming and that this effect is highly influenced by both gender and postnatal diet
