Mathematics Subject Classification 52B45 · 52A20

1 Introduction

Let \mathcal{Q}^n be a subset of \mathcal{K}^n , the set of convex bodies in \mathbb{R}^n , and let \mathcal{A} be an abelian semigroup. A function $\Phi: \mathcal{Q}^n \rightarrow \langle \mathcal{A}, + \rangle$ is called a *valuation* if

$$\Phi(K \cup L) + \Phi(K \cap L) = \Phi(K) + \Phi(L) \quad (1.1)$$

for all $K, L \in \mathcal{Q}^n$ with $K \cup L, K \cap L \in \mathcal{Q}^n$. Valuations on convex bodies are a classical concept going back to Dehn's solution in 1900 of Hilbert's Third Problem. Probably the most famous result on valuations is Hadwiger's classification theorem of continuous rigid motion invariant valuations [19]. For detailed information and a historical account on valuations on convex bodies, see [10, 21, 45]. See also [1–3, 11–17, 20, 23–32, 41, 42] for some of the for more recent contributions.

Let K be a compact starshaped subset in \mathbb{R}^n . Its Minkowski functional $\|\cdot\|_K$ is defined by

Lp Harmonic Analysis Of Sl:

L^p Harmonic Analysis on $SL(2, \mathbb{R})$ William H. Barker, 1988 The central result of this paper is a characterization of the image of C^∞ G under the operator valued Fourier transform The main thread through the paper is a careful analysis of the matrix coefficients for the discrete series and principal series of representations of $SL(2, \mathbb{R})$ The paper is long very technical and is not for the faint hearted L^p Harmonic Analysis on $SL(2, \mathbb{R})$ William H. Barker, 1988 *The Bellman Function Technique in Harmonic Analysis* Vasily Vasyunin, Alexander Volberg, 2020-08-06 The Bellman function a powerful tool originating in control theory can be used successfully in a large class of difficult harmonic analysis problems and has produced some notable results over the last thirty years This book by two leading experts is the first devoted to the Bellman function method and its applications to various topics in probability and harmonic analysis Beginning with basic concepts the theory is introduced step by step starting with many examples of gradually increasing sophistication culminating with Calderón Zygmund operators and end point estimates All necessary techniques are explained in generality making this book accessible to readers without specialized training in non linear PDEs or stochastic optimal control Graduate students and researchers in harmonic analysis PDEs functional analysis and probability will find this to be an incisive reference and can use it as the basis of a graduate course **Symplectic Methods in Harmonic Analysis and in Mathematical Physics** Maurice A. de Gosson, 2011-07-30 The aim of this book is to give a rigorous and complete treatment of various topics from harmonic analysis with a strong emphasis on symplectic invariance properties which are often ignored or underestimated in the time frequency literature The topics that are addressed include but are not limited to the theory of the Wigner transform the uncertainty principle from the point of view of symplectic topology Weyl calculus and its symplectic covariance Shubin's global theory of pseudo differential operators and Feichtinger's theory of modulation spaces Several applications to time frequency analysis and quantum mechanics are given many of them concurrent with ongoing research For instance a non standard pseudo differential calculus on phase space where the main role is played by Bopp operators also called Landau operators in the literature is introduced and studied This calculus is closely related to both the Landau problem and to the deformation quantization theory of Flato and Sternheimer of which it gives a simple pseudo differential formulation where Feichtinger's modulation spaces are key actors This book is primarily directed towards students or researchers in harmonic analysis in the broad sense and towards mathematical physicists working in quantum mechanics It can also be read with profit by researchers in time frequency analysis providing a valuable complement to the existing literature on the topic A certain familiarity with Fourier analysis in the broad sense and introductory functional analysis e.g the elementary theory of distributions is assumed Otherwise the book is largely self contained and includes an extensive list of references **Harmonic Analysis and Group Representations** A. Lie Theory Jean-Philippe Anker, Bent Orsted, 2006-02-25 Semisimple Lie groups and their algebraic analogues over fields other than the reals are of fundamental importance in geometry analysis and mathematical physics Three independent self contained volumes under the general title of Lie Theory feature survey work and original results by well established researchers in key areas of semisimple Lie theory Harmonic Analysis on Symmetric Spaces General Plancherel Theorems presents extensive surveys by E P van den Ban H Schlichtkrull and P Delorme of the spectacular progress over the past decade in deriving the Plancherel theorem on reductive symmetric spaces Well suited for both graduate students and researchers in semisimple Lie theory and neighboring fields possibly even mathematical cosmology it provides a broad clearly focused examination of semisimple Lie groups and their integral importance and applications to research in many branches of mathematics and physics Knowledge of basic representation theory of Lie groups as well as familiarity with semisimple Lie groups symmetric spaces and parabolic subgroups is required

Geometric Harmonic Analysis V Dorina Mitrea, Irina Mitrea, Marius Mitrea, 2023-08-22 This monograph presents a comprehensive self contained and novel approach to the Divergence Theorem through five progressive volumes Its ultimate aim is to develop tools in Real and Harmonic Analysis of geometric measure theoretic flavor capable of treating a broad spectrum of boundary value problems formulated in rather general geometric and analytic settings The text is intended for researchers graduate students and industry professionals interested in applications of harmonic analysis and geometric measure theory to complex analysis scattering and partial differential equations The ultimate goal in Volume V is to prove well posedness and Fredholm solvability results concerning boundary value problems for elliptic second order homogeneous constant complex coefficient systems and domains of a rather general geometric nature The formulation of the boundary value problems treated here is optimal from a multitude of points of view having to do with geometry functional
