Human Ethology Irenaus Eibl-Eibesfeldt, 2017-07-28 With the discovery of conditioned reflexes by I P Pavlov the possibilities for experimenting following the example set by the classical exact sciences were made available to the behavioral sciences Many psychologists hoped that the component parts of behavior had also been found from which the entire multifaceted cosmos of behavior could then be constructed An experimentally oriented psychology subsequently developed including the influential school of behaviorism This first text on human ethology presents itself as a unified work even though not every area could be treated with equal depth For example a branch of ethology has developed in the past decade which places particular emphasis on ecology and population genetics This field known as sociobiology has enriched discussion beyond the boundaries of behavioral biology through its stimulating and often provocative theses After vigorous

debates between behaviorists anthropologists and sociologists we have entered a period of exchange of thoughts and a mutual approach which in many instances has led to cooperative projects of researchers from different disciplines This work offers a biological point of view for discussion and includes data from the author s cross cultural work and research from the staff of his institute It confirms above all else the astonishing unity of mankind and paints a basically positive picture of how we are moved by the same passions jealousies friendliness and active curiosity The need to understand ourselves has never been as great as it is today An ideologically torn humanity struggles for its survival Our species does not know how it should compensate its workers and it experiments with various economic systems constitutions and forms of government It struggles for freedom and stumbles into newer conflicts Population growth is apparently completely out of hand and at the same time many resources are being depleted We must consider our existence ratio
