The proliferation of massive data sets brings with it a series of special computational challenges. This data avalanche arises in a wide range of scientific and commercial applications. With advances in computer and information technologies many of these challenges are beginning to be addressed by diverse inter disciplinary groups that include computer scientists, mathematicians, statisticians and engineers working in close cooperation with application domain experts. High profile applications include astrophysics, bio technology, demographics, finance, geographical information systems, government, medicine, telecommunications, the environment and the internet. John R. Tucker of the Board on Mathematical Sciences has stated: "My interest in this problem, Massive Data Sets, is that I see it as the most important cross cutting problem for the mathematical sciences in practical problem solving for the next decade because it is so pervasive." The *Handbook of Massive Data Sets* is comprised of articles written by experts on selected topics that deal with some major aspect of massive data sets. It contains chapters on information retrieval, both in the internet and in the traditional sense, web crawlers, massive graphs, string processing, data compression, clustering methods, wavelets, optimization, external memory algorithms and data structures. The US national cluster project, high performance computing, data warehouses, data cubes, semi structured data, data squashing, data quality, billing in the large, fraud detection and data processing in astrophysics, air pollution, biomolecular data, earth observation and the environment.

difficulty is encountered because of Earth curvature In the past especially in hydrography due to the type of work surveying was carried out on the principles of ordinary practice but in a very rough manner rapidity of execution being of paramount importance the permissible error was sometimes large The relative positions of the main surface features were obtained by aid of portable instruments such as sextants and lead lines tide poles and logships Sketching just like military surveying was often filling in the smaller detail In contrary survey works done by the national mapping agencies NMAs were of a higher level and comprised the delimitation of boundaries as well as topographical surveys
