Semiconductors and Semimetals, 1990-05-23 Semiconductors and Semimetals *Semiconductors and Semimetals* Robert K. Willardson, 2003 *Thin-Film Diamond II* Christopher Nebel, 2004-04-19 Part II reviews the state of the art of thin film diamond a very promising new semiconductor that may one day rival silicon as the material of choice for electronics Diamond has the following important characteristics it is resistant to radiation damage chemically inert and biocompatible and it will become the material for bio electronics in vivo applications radiation detectors and high frequency devices Thin Film Diamond II is the first book to summarize state of the art of CVD diamond in depth It covers the most recent results regarding growth and structural properties doping and defect characterization hydrogen in and on diamond as well as surface properties in general applications of diamond in electrochemistry as detectors and in surface acoustic wave devices Accessible by both experts and non experts in the field of semi conductors research and technology each chapter is written in a tutorial format Assisting engineers to manufacture devices with optimized electronic properties Truly international this volume contains chapters written by recognized experts representing academic and industrial institutions from Europe Japan and the US ULSI Science and Technology, 1989 C. M. Osburn, John M. Andrews, 1989 Silicon-Germanium Strained Layers and Heterostructures M. Willander, Suresh C. Jain, 2003-10-02 The study of Silicone Germanium strained layers has broad implications for material scientists and engineers in particular those working on the design and modelling of semi conductor devices Since the publication of the original volume in 1994 there has been a steady flow of new ideas new understanding new Silicon Germanium SiGe structures and new devices with enhanced performance Written for both students and senior researchers the 2nd edition of Silicon Germanium Strained Layers and Heterostructures provides an essential up date of this important topic describing in particular the recent developments in technology and modelling Fully revised and updated 2nd edition incorporating important recent breakthroughs and a complete literature review The extensive bibliography of over 400 papers provides a comprehensive and coherent overview of the subject Appropriate for students and senior researchers *Laser Processing of Thin Films and Microstructures* Ian W. Boyd, 2013-03-08 This text aims at providing a comprehensive and up to date treatment of the new and rapidly expanding field of laser processing of thin films particularly though by no means exclusively of recent progress in the dielectrics area The volume covers all the major aspects of laser processing technology in general from the background and history to its many potential applications and from the theory to the necessary experimental considerations It highlights and compares the vast array of processing conditions now available with intense photon beams as well as the properties of the films and microstructures produced Separate chapters deal with the fundamentals of laser interactions with matter and with experimental considerations Detailed consideration is also given to film deposition nucleation and growth oxidation and annealing as well as selective and localized etching and ablation not only in terms of the various photon induced processes but also with respect to traditional
