**Potential Theory II** H. Bauer, 1971

**Potential Theory** Jürgen Bliedtner, Wolfgang Hansen, 2012-12-06

During the last thirty years potential theory has undergone a rapid development much of which can still only be found in the original papers. This book deals with one part of this development and has two aims. The first is to give a comprehensive account of the close connection between analytic and probabilistic potential theory with the notion of a balayage space appearing as a natural link. The second aim is to demonstrate the fundamental importance of this concept by using it to give a straight presentation of balayage theory which in turn is then applied to the Dirichlet problem. We have considered it to be beyond the scope of this book to treat further topics such as duality, ideal boundary and integral representation, energy and Dirichlet forms. The subject matter of this book originates in the relation between classical potential theory and the theory of Brownian motion. Both theories are linked with the Laplace operator. However, the deep connection between these two theories was first revealed in the papers of S. KAKUTANI [1, 2, 3], M. KAC [1] and J. L. DOOB [2] during the period 1944-54. This can be expressed by the fact that the harmonic measures which occur in the solution of the Dirichlet problem are hitting distributions for Brownian motion or equivalently that the positive hyperharmonic functions for the Laplace equation are the excessive functions of the Brownian semi-group. **Probability and Information Theory II** M. Behara, K. Krickeberg, J.

Wolfowitz, 2006-11-15 *Functional Analysis II* Svetozar Kurepa, Hrvoje Kraljevic, Davor Butkovic, 2006-11-15. This volume consists of a long monographic paper by J. Hoffmann-Jorgensen and a number of shorter research papers and survey articles covering different aspects of functional analysis and its application to probability theory and differential equations.

**Bulletin of the American Mathematical Society** American Mathematical Society, 1904 **Bulletin (new Series) of the American Mathematical Society**, 1899 Potential Theory on Harmonic Spaces Corneliu Constantinescu, Aurel Cornea, 1972-12-05. There has been a considerable revival of interest in potential theory during the last 20 years. This is made evident by the appearance of new mathematical disciplines in that period which now a days are considered as parts of potential theory. Examples of such disciplines are the theory of Choquet capacities of Dirichlet spaces of martingales and Markov processes of integral representation in convex compact sets as well as the theory of harmonic spaces. All these theories have roots in classical potential theory. The theory of harmonic spaces, sometimes also called axiomatic theory of harmonic functions, plays a particular role among the above mentioned theories. On the one hand, this theory has particularly close connections with classical potential theory. Its main notion is that of a harmonic function and its main aim is the generalization and unification of classical results and methods for application to an extended class of elliptic and parabolic second order partial differential equations. On the other hand, the theory of harmonic spaces is closely related to the theory of Markov processes. In fact, all important notions and results of the theory have a probabilistic interpretation. **Proceedings**
