

In what has now become the standard model for sequence stratigraphy, a *depositional sequence* comprises an unconformity-bounded package of genetically related strata, whose internal geometries are influenced largely by fluctuating sea level (Fig. 1). This model evolved from regional mapping (Sloss 1963), and was later developed from seismic-reflection profiles on passive continental margins (Payton 1977). It was further extended to a higher resolution using data from the surface and subsurface in many geological settings (Mutti 1985; Wilgus *et al.* 1988; Van Wagoner *et al.* 1990). Here

we do not provide a comprehensive summary of the terminology that has grown-up around sequence stratigraphy: judging by its sparse usage within the papers of this volume much of it is redundant anyway. The interested reader should refer to the reviews of Haq (1991), Vail *et al.* (1991), Mitchum & Van Wagoner (1991), Posamentier *et al.* (1992) and Posamentier & James (1993) for further details. In essence, sequence stratigraphy is practised through the recognition of key surfaces which define the boundaries of packages of genetically related strata (*systems tracts*) and by the recognition

**Fig. 1.** The standard sequence stratigraphical model for siliciclastic systems (based on Haq *et al.* 1988 and Christie-Blick & Driscoll 1995) showing the different areas covered by papers in this volume. Wright (this volume) and Coe (this volume) discuss successions that were carbonate ramps, with an implied sequence stratigraphical character not dissimilar to siliciclastic deposits (see Schlager 1992; Tucker *et al.* 1993). A *sequence boundary* (SB) is defined as an unconformity and its basinward correlative conformity. The lower of the sequence boundaries in this figure (*type 1*) is distinguished from the upper one (*type 2*) by its association with 'fan' sedimentation at the toe of slope, which has been related to rapid, high-magnitude, relative sea-level fall. The *maximum flooding surface* (MFS) corresponds to the time of greatest landward extent of the facies belts within a depositional sequence, and is characterized by detrital sediment starvation in basinward regions. The *transgressive surface* (TS) is a widespread horizon across which deep-water sediments abruptly overlie shallow water sediments, and it forms as the underlying progradational sedimentary succession is flooded by rising relative sea level. *Systems tracts* are defined between these key surfaces. For full discussion of this model, definition of systems tracts and their relation to relative and eustatic sea-level change the reader should refer to Haq *et al.* (1988), Posamentier & Vail (1988), Posamentier *et al.* (1988, 1990, 1992), Mitchum & Van Wagoner (1991), Vail *et al.* (1991), Jacquini *et al.* (1992) and Posamentier & James (1993). Useful critiques and alternative models are provided by Miall (1986), Galloway (1989), Carter *et al.* (1991), Fulthorpe (1991), Schlager (1991), Walker (1992) and Christie-Blick & Driscoll (1995), and references therein. As a substitute for depositional sequences as defined above, Galloway (1989) has proposed use of *genetic stratigraphic sequences* bounded by maximum flooding surfaces, and his approach has also been followed by many workers.

W. Glennie, 2009-06-29 Since the 3rd edition of this publication emphasis within the petroleum industry has shifted from exploration to appraisal and development of existing hydrocarbon resources This change is reflected in this new 4th edition which has been significantly expanded to accommodate additional material The centrepiece of the book however remains a series of descriptions in stratigraphic order of the depositional history and hydrocarbon related rock units of the

It brings together seismic examples from North and South America, Africa, Europe, Asia, and Australia and features contributions from eleven international authors who are experts in their field. It provides structural geological examples with full color illustrations and explanations so that students and industry professionals can get a better understanding of what they are being taught. It also shows seismic images in black and white print and covers compression-related structures. Representing a compilation of examples for different types of geological structures, *Atlas of Structural Geological Interpretation from Seismic Images* is a quick guide to finding analogous structures. It provides extensive coverage of seismic expression of different geological structures: faults, folds, mobile substrates, shale and salt tectonic and regional structures, and common pitfalls in interpretation. The book also includes an uninterpreted seismic section for every interpreted section so that readers can feel free to draw their own conclusion as per their conceptualization. Provides authoritative source of methodologies for seismic interpretation. Indicates sources of uncertainty and give alternative interpretations. Directly benefits those working in petroleum industries. Includes case studies from a variety of tectonic regimes. *Atlas of Structural Geological Interpretation from Seismic Images* is primarily designed for graduate students in Earth Sciences, researchers, and new entrants in industry who are interested in seismic interpretation.      *Geotitles*, 1995      **Geologic Problem Solving with Microfossils** Thomas David Demchuk, Anthony C. Graham, 2017-12-28 Through a remarkable combination of intellect, self-confidence, engaging humility, and prodigious output of published work, William R. Dickinson influenced and challenged three generations of sedimentary geologists, igneous petrologists, tectonicists, sandstone petrologists, archaeologists, and other geoscientists. A key figure in the plate tectonic revolution of the 1960s and 1970s, he explained how the distribution of sediments on Earth's surface could be traced to tectonic processes and is widely recognized as a founder of modern sedimentary basin analysis. This volume consists of 31 chapters related to Dickinson's research interests; many of the authors are his former students, their students, and their students, demonstrating his continuing profound influence.
