Training-induced cognitive and neural plasticity Julia Karbach, Torsten Schubert, 2013-07-08 Throughout the entire lifespan individuals are required to adapt to the demands of changing developmental contexts and dynamic social environments The potential modifiability of a person s cognitive and neural processes has been referred to as plasticity One way to assess cognitive and neural plasticity is to apply training interventions and to measure the related changes in trained and untrained situations Over the last decade the literature on the effects of cognitive interventions has been growing rapidly

oftentimes focusing on the magnitude scope and maintenance of training related benefits and their transferability to untrained tasks and abilities Recent studies show that plasticity is present across the lifespan although it seems to decline in older age and that the long term maintenance as well as the transferability of training gains strongly depends on the type and the intensity of the intervention The findings from behavioral cognitive training research have also been accompanied by findings from cognitive neuroscience The related observations oftentimes point to training induced changes in a number of cortical and subcortical regions which may be responsible for the magnitude of training and of transfer effects Thus cognitive training may be a promising tool for understanding basic mechanisms of adaptive behavior on the one hand and for designing applications and interventions within different disciplines in psychology on the other hand However not all studies have consistently shown beneficial effects of cognitive training and some questions that are critical for our understanding of plasticity are still unanswered What are the key processes mediating training effects on laboratory tasks and in real world situations Which characteristics of the training process and of the trainings situations mediate transfer effects Are training effects subject to age related changes How are training induced neural changes in the brain related to improvements in cognitive performance How effective are training interventions in patients with specific cognitive impairments To what extent can age related cognitive decline be compensated by means of cognitive training The focus of this Research Topic is on training induced cognitive and neural plasticity across the lifespan The goal is to provide a broad scope of state of the art research in order to enhance our knowledge regarding the mechanisms underlying plasticity We invite contributions applying behavioral computational and neuroscientific approaches reviews and theoretical contributions Contributions are also welcomed if they focus on the implications of cognitive training in applied fields like educational and clinical settings as well as rehabilitation and training science

Inhibitory Control Training Sara Palermo, Massimo Bartoli, 2020-04-22 Inhibitory control is a critical neurocognitive skill for navigating cognitive social and emotional challenges It rapidly increases during the preschool period and is important for early cognitive development as it is a crucial component of executive functioning self regulation and impulsivity Inhibitory control training ICT is a novel intervention in which participants learn to associate appetitive cues with inhibition of behavior It is being considered a promising approach in the treatment of psychopathology and appetitive behaviors This book aims to bring together knowledge on the topic considering research clinic and forensic field of intervention Indeed this book can be considered an excellent synopsis of perspectives methods empirical evidence and international references

experiential knowledge in a thoroughly applied context The prevailing paradigm that has existed within the academic enquiry of sports nutrition has typically viewed macronutrients as fuel for exercise endeavours While this notion provides a basis of quantitative nutritional support what happens when our active individual lacks adequate digestive health to assimilate these foods and in the process creates an inflammatory tone in their body And what happens when our aspiring athlete is genetically not suited to the diet that is prescribed by the sports nutritionist which is based merely on the energetic needs of their sport The underlying aim of Integrative Sport and Exercise Nutrition is to encourage sport exercise and nutrition professionals academics and students to embrace the physiological complexity and individuality of an exercising person This approach highlights the need to go beyond traditional macronutrient approaches dominant in this field and consider how our food impacts physiological health from an integrative body systems perspective Within the context of heavy training loads often alongside significant life stressors such practitioners can support the robust health and performance requirements of active individuals This cutting edge book thereby brings together the scientific voice of academics with the real world experience of nutrition and exercise practitioners and by doing so the authors wish to stimulate a new paradigm of thought towards integrative and personalised thinking in sport and exercise

short term practice ranging from few hours to several weeks 2 cross sectional studies using expert novice paradigm to explore the behavioral and neural system change induced by extensive brain mind body practice 3 the mediators influence the relationship between practice and health outcomes and 4 new viewpoints on brain mind body practice from theoretical perspectives Here we briefly highlight these articles aiming to provide a deep understanding for the association between practice plasticity and health for readers Additionally it offers new insights for developing possible practice interventions for clinical treatment of neurological dysfunction or disorders
