Sensory Processing In The Mammalian Brain Neural Substrates And Experimental Strategies:

Sensory Processing in the Mammalian Brain Gerhard Werner, University of Pittsburgh, Center for Neuroscience, 1989 The essays in this edited volume are written by neuroscientists distinguished for their research into the neurobiology of mammalian sensory processing Covering a wide range of current experimental approaches to the investigation of the mammalian brain the contributors address the nature of the central neural representation of the major sensory systems taste smell hearing sight pain and touch Comparisons of their experimental rationales methods of approach and of the resulting data demonstrate the commonality of many features of neural organization between the different sensory systems explored Among the features discussed in detail are the import of elaborately structured maps of sensory function in the cerebral cortex the degree of anatomical and physiological separation of different aspects of the input within single sensory systems the nature of neuron assemblies responsible for complex analytic events and the relation between metabolic patterns of activity and physiological recording of response properties The importance of theoretical models new imaging techniques and investigations using neural transplants for experimental analysis of sensory systems are demonstrated and the influence of the concepts of cognitive psychology on experimental investigations of sensory processing is discussed A series of commentaries links the book's different sections indicating for the reader those aspects of the experimental findings that are of particular importance to an understanding of the field as a whole

The Mammalian Auditory Pathway:

Neurophysiology Richard R. Fay, 2013-12-01 The Springer Handbook of Auditory Research presents a series of comprehensive and synthetic reviews of the fundamental topics in modern auditory research It is aimed at all individuals with interests in hearing research including advanced graduate students postdoctoral researchers and clinical investigators The volumes will introduce new investigators to important aspects of hearing science and will help established investigators to better understand the fundamental theories and data in fields of hearing that they may not normally follow closely Each volume is intended to present a particular topic comprehensively and each chapter will serve as a synthetic overview and guide to the literature As such the chapters present neither exhaustive data reviews nor original research that has not yet appeared in peer reviewed journals The series focusses on topics that have developed a solid data and conceptual foundation rather than on those for which a literature is only beginning to develop New research areas will be covered on a timely basis in the series as they begin to mature

Somesthesis and the Neurobiology of the Somatosensory Cortex

O. Franzen, R. Johansson, L. Terenius, 2012-12-06 This volume is a compilation of current research on somatosensation and its underlying mechanisms written by international experts from a broad range of disciplines It is divided into six sections structural basis of information processing and neocortical neurotransmitters psychophysics of somatosensation cortical representation of somatosensation sensory motor interface neuronal population behavior cortical neurocomputation and modelling It highlights not only important new findings but also novel methods and technologies applied to major unresolved

issues in the field of neuroscience The number of methods for investigating the neural mechanisms of somatosensory perception has grown substantially in the last decade The book encompasses levels of inquiry from ionic channels single unit recordings of neural activity and functional brain imaging of the coordinated activity of large neuronal ensembles to human psychophysics of controlled somatic stimulation This work is of great value for researchers and students interested in the dynamic neuronal mechanisms involved in the complex processes of sensory perception and provides a picture of our present understanding of the neural representation of the external world relayed through the somatosensory system Synergetics of Cognition Hermann Haken, Michael Stadler, 2012-12-06 This book presents the invited lectures given at the International Symposium on Synergetics of Cognition held at SchloB Elmau Bavaria Fed Rep of Germany June 4 8 1989 The understanding of the processes underlying cognition is certainly one of the most challenging and difficult problems confronting the human mind It is an enterprise that requires the cooperation of scientists from fields ranging from the neurosciences and psychology through biology to the computer sciences physics and mathematics The papers included in this volume reflect this joint effort As will be evident there is a remarkable convergence of ideas stemming from various fields for instance the earlier ideas on Gestalt theory celebrate a come back and remarkable analogies are being established with modern concepts of self organization as dealt with in the interdisciplinary field of synergetics The individual topics range from the microscopic level where new exciting results on specific oscillations of neural activity are reported to computer simulations of perception and finally psychological experiments at the macroscopic level We hope that this book will convey to its readers the same enthusiasm that was felt by the participants of the symposium We wish to thank Mrs U Funke for the excellent organisation of the symposium and the Volkswagen Stiftung Hannover for its financial support We are furthermore grateful to Christoph Stadler and Zora Franko for their help in compiling the name and subject indexes Finally we wish to thank Springer Verlag in particular Dr Angela Lahee for the excellent cooperation

23 Problems in Systems Neuroscience J. Leo van Hemmen, Terrence J. Sejnowski, 2005-12-08 The complexity of the brain and the protean nature of behavior remain the most elusive area of science but also the most important van Hemmen and Sejnowski invited 23 experts from the many areas from evolution to qualia of systems neuroscience to formulate one problem each Although each chapter was written independently and can be read separately together they provide a useful roadmap to the field of systems neuroscience and will serve as a source of inspirations for future explorers of the brain

Mathematical Approaches to Brain Functioning Ivan Dvorak (Ed), Arun V. Holden, 1991 Networking of Psychophysics, Psychology and Neurophysiology Bruce J. West, Paolo Grigolini, To many scientists the gap between the nineteenth century views of consciousness proposed by the psychologist William James and that developed by the inventor of psychophysics Gustav Fechner has never seemed wider However the twentieth century concept of collective cooperative behavior within the brain has partially reconciled these diverging perspectives suggesting the notion of consciousness as a physical phenomenon A kernel of twenty first century investigators

bases their investigations on physiological fluctuations experiments These fluctuations although apparently erratic when analyzed with advanced methods of fractal statistical analysis reveal the emergence of complex behavior intermediate between complete order and total randomness a property usually referred to as temporal complexity Others with the help of modern technologies such MRI establish a more direct analysis of brain dynamics and focus on the brain's topological complexity Consequently the two groups adopt different approaches the former being based on phenomenological and macroscopic considerations and the latter resting on the crucial role of neuron interactions The neurophysiology research work has an increasing overlap with the emerging field of complex networks whereas the behavior psychology experiments have until recently ignored the complex cooperative dynamics that are proved by increasing experimental evidence to characterize the brain function It is crucial to examine both the experimental and theoretical studies that support and those that challenge the view that it is an emergent collective property that allows the healthy brain to function What needs to be discussed are new ways to understand the transport of information through complex networks sharing the same dynamical properties as the brain In addition we need to understand information transfer between complex networks say between the brain and a controlled experimental stimulus Experiments suggest that brain excitation is described by inverse power law distributions and recent studies in network dynamics indicate that this distribution is the result of phase transitions due to neuron network dynamics It is important to stress that the development of dynamic networking establishes a connection between topological and temporal complexity establishing that a scale free distribution of links is generated by the dynamic correlation between dynamic elements located at very large Euclidean distances from one another Dynamic networking and dynamics networks suggest a new way to transfer information the long distance communication through local cooperative interaction It is anticipated that the contributed discussions will clarify how the global intelligence of a complex network emerges from the local cooperation of units and the role played by critical phase transitions in the observed persistence of this cooperation

Neural Aspects of Tactile Sensation J.W. Morley, 1998-07-09 The world within reach is characterised to a large extent by our ability to sense objects through touch Research into the sensation of touch has a long history However it is only relatively recently that significant advances have been made in understanding how information about objects we touch is represented in both the peripheral and central divisions of the nervous systems This volume draws together the increasing body of knowledge regarding the mechanisms underlying tactile sensation and how they relate to tactile perception Individual chapters address the response of mechanoreceptors to stimuli including movement and shape the role of the somatosensory cortex in processing tactile information the psychophysics and neurophysiology of the detection and categorisation of somesthetic stimuli perceptual constancy recent findings in regard to short term and long term plasticity in the somatosensory cortex and the psychophysical correlates of this plasticity and parallel versus serial information processing in the cortex The authors look at past and current research and comment on the direction of future investigation

relating findings from psychophysical studies of tactile behavior to our growing understanding of the underlying neural mechanisms

The Auditory System Frank E. Musiek, Jane A. Baran, 2018-06-29 This updated second edition of *The Auditory System: Anatomy, Physiology, and Clinical Correlates* remains an essential text for audiology students and clinicians. Mind, Brain, and Adaptation in the Nineteenth Century Robert Maxwell Young, 1990 This is a reissue of a book published by the Clarendon Press in 1970 with a new introduction to take account of recent developments in the history of 19th century neuroscience. The author examines ideas of the nature and localization of the functions of the brain in the light of the philosophical constraints at work in the sciences of mind and brain in the 19th century. Particular attention is paid to phrenology, sensory motor physiology, associationist psychology, and the theory of evolution as applied to the study of psychology. The author argues that the methods and assumptions of modern science achieved apparent success in this domain at the expense of the biological approach which justified the integration of formerly disparate traditions. The method of historical case study is used to illuminate the assumptions of current research.

The Auditory Cortex Jeffery A. Winer, Christoph E. Schreiner, 2010-12-02 There has been substantial progress in understanding the contributions of the auditory forebrain to hearing, sound localization, communication, emotive behavior, and cognition. *The Auditory Cortex* covers the latest knowledge about the auditory forebrain, including the auditory cortex as well as the medial geniculate body in the thalamus. This book will cover all important aspects of the auditory forebrain organization and function, integrating the auditory thalamus and cortex into a smooth coherent whole. Volume One covers basic auditory neuroscience. It complements *The Auditory Cortex: Volume 2: Integrative Neuroscience*, which takes a more applied clinical perspective.
