Handbook of Methods and Instrumentation in Separation Science, 2009-11-11

Handbook of Methods and Instrumentation in Separation Science Volume 1 provides concise overviews and summaries of the main methods used for separation. It is based on the Encyclopedia of Separation Science. The handbook focuses on the principles of methods and instrumentation. It provides general concepts concerning the subject matter; it does not present specific procedures. This volume discusses the separation processes including affinity methods, analytical ultracentrifugation, centrifugation, chromatography and use of decanter centrifuge and dye. Each methodology is defined and compared with other separation processes. It also provides specific techniques, principles and theories concerning each process. Furthermore, the handbook presents the applications, benefits and validation of the processes described in this book. This handbook is an excellent reference for biomedical researchers, environmental and production chemists, flavor and fragrance technologists, food and beverage technologists, academic and industrial librarians and nuclear researchers. Students and novices will also find this handbook useful for practice and learning. One stop source for information on separation methods. General overviews for quick orientation. Ease of use for finding results fast. Expert coverage of major separation methods. Coverage of techniques for all sizes of samples, pico level to kilo level.

Methods of Protein Separation Nicholas Catsimpoolas, 2013-06-29 This open end treatise on methods concerning protein separation had its beginning in an American Chemical Society symposium entitled Contemporary Protein Separation Methods which was held in Atlantic City New Jersey in September 1974 The purpose of the symposium and subsequently of the present work was to review the available modern techniques and underlying principles for achieving one of the very important tasks of experimental biology namely the separation and characterization of proteins present in complex biological mixtures Physicochemical characterization was covered only as related to the parent method of fractionation and therefore involved mostly mass transport processes Additionally the presentation of methods for gaining insight into complex interacting protein profiles was considered of paramount importance in the interpretation of separation patterns Finally specific categories of proteins e.g. chemically modified deriving from a specific tissue conjugated to different moieties etc require meticulous trial and selection and/or modification of existing methodology to carry out the desired separation In such cases the gained experience provides valuable guidelines for further experimentation Although powerful techniques exist today for the separation and related physicochemical characterization of proteins many biological fractionation problems require further innovations It is hoped that the description in the present treatise of some of the available separation tools and their limitations will provide the necessary integrated background for new developments in this area Nicholas Catsimpoolas Cambridge Massachusetts v **CONTENTS** Contents of Volume 1 xvii Chapter 1 Scanning Gel Chromatography Gary K Ackers I
