Beyond Manufacturing Resource Planning (MRP II) Andreas Drexel, Alf Kimms, 2013-11-11 The logic of Manufacturing Resource Planning MRP II is implemented in most commercial production planning software tools and is commonly accepted by practitioners However these people are not satisfied with production planning and complain about long lead times high work in process and backlogging As many researchers have pointed out the reason for these shortcomings is inherent to the methods that are used The research community is thus eager to find more sophisticated approaches This book is an attempt to compile some state of the art work in the field of production planning research It includes material that somehow dominates the existing MRP II concept 15 articles written by 36 authors from 10 countries cover many aspects related to MRP II All papers went through a single blind refereeing process before they were selected for being published in this book When we received papers for this issue we discovered that MRP II is a topic about which not only management scientists show interest As the list of authors proves industrial engineers computer scientists and operations researchers from academia as well as practitioners have contributed to this book This we hope makes the book of value for a broad audience We thank all authors who submitted papers And we are indebted to Dr Werner Muller from Springer for his support in this book project

Production Planning with Capacitated Resources and Congestion Hubert Missbauer, Reha Uzsoy, 2020-02-26 This book presents a comprehensive overview of recent developments in production planning The monograph begins with an introductory chapter reviewing the need for these production planning models that operate by determining time phased releases of work into the facility or supply chain relating these to the Manufacturing Planning and Control MPC and Advanced Planning and Scheduling APS frameworks that form the basis of most academic research and industrial practice The extensive body of work on Workload Control is also placed in this context and proves the need for improved models with a discussion of the difficulties these approaches encounter The next two chapters present a detailed review of the state of the art in optimization models based on exogenous planned lead times and examines the cases where these can take both integer and fractional values The difficulties arising in estimating planned lead times are consistent with factory behavior which are highlighted noting that many of these lead to non convex optimization models Attempts to address these difficulties by iterative multimodel approaches that combine

simulation and mathematical programming are also discussed in detail The next three chapters of the volume address the set of techniques developed using clearing functions which represent the expected output of a resource in a planning period as a function of the expected workload of the resource during that period The chapters on this subject propose a basic optimization model for multiple products discuss the difficulties of this model and some possible solutions It also reviews prior work and discuss a number of alternative formulations of the clearing function concept with their respective advantages and disadvantages Applications to lot sizing decisions and a number of other specific problems are also described This volume concludes with an assessment of the state of the art described in the volume and several directions for future work
