Nonlinear Dispersive Partial Differential Equations and Inverse Scattering Peter D. Miller, Peter A. Perry, Jean-Claude Saut, Catherine Sulem, 2019-11-14 This volume contains lectures and invited papers from the Focus Program on Nonlinear Dispersive Partial Differential Equations and Inverse Scattering held at the Fields Institute from July 31 August 18 2017 The conference brought together researchers in completely integrable systems and PDE with the goal of advancing the understanding of qualitative and long time behavior in dispersive nonlinear equations The program included Percy Deift's Coxeter lectures which appear in this volume together with tutorial lectures given during the first week of the focus program The research papers collected here include new results on the focusing nonlinear Schrödinger NLS equation the massive Thirring model and the Benjamin Bona Mahoney equation as dispersive PDE in one space dimension as well as the Kadomtsev Petviashvili II equation the Zakharov Kuznetsov equation and the Gross Pitaevskii equation as dispersive PDE in two space dimensions The Focus Program coincided with the fiftieth anniversary of the discovery by Gardner Greene Kruskal and Miura that the Korteweg de Vries KdV equation could be integrated by exploiting a remarkable connection between KdV and the spectral theory of Schrödinger's equation in one space dimension This led to the discovery of a number of completely integrable models of dispersive wave propagation including the cubic NLS equation and the derivative NLS equation in one space dimension and the Davey Stewartson Kadomtsev Petviashvili and Novikov Veselov equations in two space dimensions These models have been extensively studied and in some cases the inverse scattering theory has been put on rigorous footing It has been used as a powerful analytical tool to study global well posedness and elucidate asymptotic behavior of the solutions including dispersion soliton resolution and semiclassical limits *Differential Equations and Applications, Volume 4* Yeol Je Cho, 2007-07-02 The aim of this volume is to introduce new topics on the areas of difference differential integrodifferential and integral equations evolution equations control and optimisation theory dynamic system theory queueing theory and electromagnetism and their applications *Excursions in Harmonic Analysis, Volume 4* Radu Balan, Matthew Begué, John J. Benedetto, Wojciech Czaja, Kasso A. Okoudjou, 2015-10-20 This volume consists of contributions spanning a wide spectrum of harmonic analysis and its applications written by speakers at the February Fourier Talks from 2002 2013 Containing cutting edge results by an impressive array of mathematicians engineers and scientists in academia industry and government it will be an excellent reference for graduate students researchers and professionals in pure and applied mathematics physics and engineering Topics covered include Special Topics in Harmonic Analysis Applications and Algorithms in the Physical Sciences Gabor Theory RADAR and Communications Design Theory and Applications The February Fourier Talks are held annually at the Norbert Wiener Center for Harmonic Analysis and Applications Located at the University of Maryland College Park the Norbert Wiener Center provides a state of the art research venue for the broad emerging area of mathematical engineering *Nonlinear Evolution and Difference Equations of Monotone Type in Hilbert*

Spaces Behzad Djafari Rouhani, 2019-05-20 This book is devoted to the study of non linear evolution and difference equations of first or second order governed by maximal monotone operator This class of abstract evolution equations contains ordinary differential equations as well as the unification of some important partial differential equations including heat equation wave equation Schrodinger equation etc The book contains a collection of the authors work and applications in this field as well as those of other authors

New Tools for Nonlinear PDEs and Application Marcello D'Abbicco, Marcelo Rempel Ebert, Vladimir Georgiev, Tohru Ozawa, 2019-05-07 This book features a collection of papers devoted to recent results in nonlinear partial differential equations and applications It presents an excellent source of information on the state of the art new methods and trends in this topic and related areas Most of the contributors presented their work during the sessions Recent progress in evolution equations and Nonlinear PDEs at the 12th ISAAC congress held in V xj Sweden Even if inspired by this event this book is not merely a collection of proceedings but a stand alone project gathering original contributions from active researchers on the latest trends in nonlinear evolution PDEs

Analysis and Optimization of Differential Systems Viorel Barbu, Irena Lasiecka, Dan Tiba, Constantin Varsan, 2013-06-05 Analysis and Optimization of Differential Systems focuses on the qualitative aspects of deterministic and stochastic differential equations Areas covered include Ordinary and partial differential systems Optimal control of deterministic and stochastic evolution equations Control theory of Partial Differential Equations PDE s Optimization methods in PDE s with numerous applications to mechanics and physics Inverse problems Stability theory Abstract optimization problems Calculus of variations Numerical treatment of solutions to differential equations and related optimization problems These research fields are under very active development and the present volume should be of interest to students and researchers working in applied mathematics or in system engineering This volume contains selected contributions presented during the International Working Conference on Analysis and Optimization of Differential Systems which was sponsored by the International Federation for Information Processing IFIP and held in Constanta Romania in September 2002 Among the aims of this conference was the creation of new international contacts and collaborations taking advantage of the new developments in Eastern Europe particularly in Romania The conference benefited from the support of the European Union via the EURROMAT program

Dispersive Equations and Nonlinear Waves Herbert Koch, Daniel Tataru, Monica Vişan, 2014-07-14 The first part of the book provides an introduction to key tools and techniques in dispersive equations Strichartz estimates bilinear estimates modulation and adapted function spaces with an application to the generalized Korteweg de Vries equation and the Kadomtsev Petviashvili equation The energy critical nonlinear Schrödinger equation global solutions to the defocusing problem and scattering are the focus of the second part Using this concrete example it walks the reader through the induction on energy technique which has become the essential methodology for tackling large data critical problems This includes refined inverse Strichartz estimates the existence and almost periodicity of minimal blow up solutions and the development of long time Strichartz inequalities The

third part describes wave and Schrödinger maps Starting by building heuristics about multilinear estimates it provides a detailed outline of this very active area of geometric dispersive PDE It focuses on concepts and ideas and should provide graduate students with a stepping stone to this exciting direction of research Dynamics with Inequalities David E.

Stewart,2011-08-04 The first book that comprehensively addresses dynamics with inequalities **Heisenberg's Quantum Mechanics** Mohsen Razavy,2011 This book provides a detailed account of quantum theory with a much greater emphasis on the Heisenberg equations of motion and the matrix method No other texts have come close to discuss quantum theory in terms of depth of coverage The book features a deeper treatment of the fundamental concepts such as the rules of constructing quantum mechanical operators and the classical quantal correspondence the exact and approximate methods based on the Heisenberg equations the determinantal approach to the scattering theory and the LSZ reduction formalism where the latter method is used to obtain the transition matrix The uncertainty relations for a number of different observables are derived and discussed A comprehensive chapter on the quantization of systems with nonlocalized interaction is included Exact solvable models and approximate techniques for solution of realistic many body problems are also considered The book takes a unified look in the final chapter examining the question of measurement in quantum theory with an introduction to the Bell's inequalities **Evolution Equations** David Ellwood,Igor Rodnianski,Gigliola Staffilani,Jared Wunsch,2013-06-26 This volume is a collection of notes from lectures given at the 2008 Clay Mathematics Institute Summer School held in Zurich Switzerland The lectures were designed for graduate students and mathematicians within five years of the Ph D and the main focus of the program was on recent progress in the theory of evolution equations Such equations lie at the heart of many areas of mathematical physics and arise not only in situations with a manifest time evolution such as linear and nonlinear wave and Schrödinger equations but also in the high energy or semi classical limits of elliptic problems The three main courses focused primarily on microlocal analysis and spectral and scattering theory the theory of the nonlinear Schrödinger and wave equations and evolution problems in general relativity These major topics were supplemented by several mini courses reporting on the derivation of effective evolution equations from microscopic quantum dynamics on wave maps with and without symmetries on quantum N body scattering diffraction of waves and symmetric spaces and on nonlinear Schrödinger equations at critical regularity Although highly detailed treatments of some of these topics are now available in the published literature in this collection the reader can learn the fundamental ideas and tools with a minimum of technical machinery Moreover the treatment in this volume emphasizes common themes and techniques in the field including exact and approximate conservation laws energy methods and positive commutator arguments Titles in this series are co published with the Clay Mathematics Institute Cambridge MA Classical Diophantine Equations Vladimir G. Sprindzuk,2006-11-15 The author had initiated a revision and translation of Classical Diophantine Equations prior to his death Given the rapid advances in transcendence theory and diophantine approximation over recent years one might fear

that the present work originally published in Russian in 1982 is mostly superseded That is not so A certain amount of updating had been prepared by the author himself before his untimely death Some further revision was prepared by close colleagues The first seven chapters provide a detailed virtually exhaustive discussion of the theory of lower bounds for linear forms in the logarithms of algebraic numbers and its applications to obtaining upper bounds for solutions to the eponymous classical diophantine equations The detail may seem stark the author fears that the reader may react much as does the tourist on first seeing the centre Pompidou notwithstanding that Sprind zuk maintains a pleasant and chatty approach full of wise and interesting remarks His emphases well warrant now that the book appears in English close study and emulation In particular those emphases allow him to devote the eighth chapter to an analysis of the interrelationship of the class number of algebraic number fields involved and the bounds on the heights of the solutions of the diophantine equations Those ideas warrant further development The final chapter deals with effective aspects of the Hilbert Irreducibility Theorem harkening back to earlier work of the author There is no other congenial entry point to the ideas of the last two chapters in the literature

Optimization and Nonlinear Analysis Simeon Reich, 1992-07-13 Comprises the proceedings of the workshop on Optimization and Nonlinear Analysis held at the Technion in March 1990 organized by the Binational US Israel Scientific Research Fund and the Institute for Advanced Studies in Mathematics at the Technion

Modulation Spaces Árpád Bényi, Kasso A. Okoudjou, 2020-02-22 This monograph serves as a much needed self contained reference on the topic of modulation spaces By gathering together state of the art developments and previously unexplored applications readers will be motivated to make effective use of this topic in future research Because modulation spaces have historically only received a cursory treatment this book will fill a gap in time frequency analysis literature and offer readers a convenient and timely resource Foundational concepts and definitions in functional harmonic and real analysis are reviewed in the first chapter which is then followed by introducing modulation spaces The focus then expands to the many valuable applications of modulation spaces such as linear and multilinear pseudodifferential operators and dispersive partial differential equations Because it is almost entirely self contained these insights will be accessible to a wide audience of interested readers Modulation Spaces will be an ideal reference for researchers in time frequency analysis and nonlinear partial differential equations It will also appeal to graduate students and seasoned researchers who seek an introduction to the time frequency analysis of nonlinear dispersive partial differential equations
