Vibration Control of Nonlinear Mechanisms and Structures H. Ulbrich,W. Günthner,2005-11-07 During the last decades the growth of micro electronics has reduced the cost of computing power to a level acceptable to industry and has made possible sophisticated control strategies suitable for many applications Vibration c trol is applied to all kinds of engineering systems to obtain the desired dynamic behavior improved accuracy and increased reliability during operation In this context one can think of applications related to the control of structures vib tion isolation control of vehicle dynamics noise control control of machines and mechanisms and control of uid structure interaction One could continue with this list for a long time Research in the eld of vibration control is extremely comprehensive Pr lems that are typical for vibration control of nonlinear mechanisms and str tures arise in the elds of modeling systems in such a way that the model is suitable

for control design to choose appropriate actuator and sensor locations and to select the actuators and sensors The objective of the Symposium was to present and discuss methods that contribute to the solution of such problems and to demonstrate the state of the art in the field shown by typical examples The intention was to evaluate the limits of performance that can be achieved by controlling the dynamics and to point out gaps in present research and give links for areas of future research Mainly it brought together leading experts from quite different areas presenting their points of view

Advances in Mechanical Systems Dynamics Alberto Doria, Giovanni Boschetti, Matteo Massaro, 2020-02-13 Modern dynamics was established many centuries ago by Galileo and Newton before the beginning of the industrial era Presently we are in the presence of the fourth industrial revolution and mechanical systems are increasingly being integrated with electronic electrical and fluidic systems This trend is present not only in the industrial environment which will soon be characterized by the cyber physical systems of industry 4.0 but also in other environments like mobility health and bio engineering food and natural resources safety and sustainable living In this context purely mechanical systems with quasi static behavior will become less common and the state of the art will soon be represented by integrated mechanical systems which need accurate dynamic models to predict their behavior Therefore mechanical system dynamics are going to play an increasingly central role Significant research efforts are needed to improve the identification of the mechanical properties of systems in order to develop models that take non linearity into account and to develop efficient simulation tools This Special Issue aims at disseminating the latest research achievements findings and ideas in mechanical systems dynamics with particular emphasis on applications that are strongly integrated with other systems and require a multi physical approach

Bio A.I. - From Embodied Cognition to Enactive Robotics Adam Safran, Inês Hipólito, Andy Clark, 2023-12-08 Even before the deep learning revolution the landscape of artificial intelligence

AI was already changing drastically in the 90s Embodied intelligence it was proposed must play a crucial role in the design of intelligent machines This new wave was inspired by what is today known as Embodied and Enactive Cognitive Science or E Cognition which considers that cognitive activity does not reduce to the intellectual capacities of agents being able to represent their environments E cognition set AI and robotics in a new direction in which intelligent machines are required to interact with the environment and where this interaction does not reduce to explicit representations or prespecified algorithms These ideas revolutionized the way we think about intelligent machines and cognition but these theoretical advances are only partially reflected in modern approaches to AI and machine learning ML Despite deeply impressive achievements AI ML still struggles to recapitulate the kinds of intelligence we find in natural systems whether we are considering individual insects e g simultaneous localization and mapping or swarm behaviour e g flock sensing and ensemble inferences and especially the kinds of flexibility and high level reasoning characteristic of human cognition
