

Do birds come from dinosaurs?

Evolution of birds is a debate topic in science. The most widespread theory says that they come from the Theropods, dinosaurs that walked on two legs. Fossils of specimens with feathers have been found, and the Archaeopteryx, which lived 150 millions of years ago is the oldest relative known. Covered with feathers, it had a primitive wing and it is believed it flew. However, it kept a good amount of dinosaur-like features.

STRANGE BIRD

The Archaeopteryx lithographica is the most primitive bird known. It lived in the Jurassic, 150 years ago. It was carnivorous and about 50 cm of height, and 20 long, similar to a crow. Its features make it the closest model to observe the transition between dinosaurs and birds.

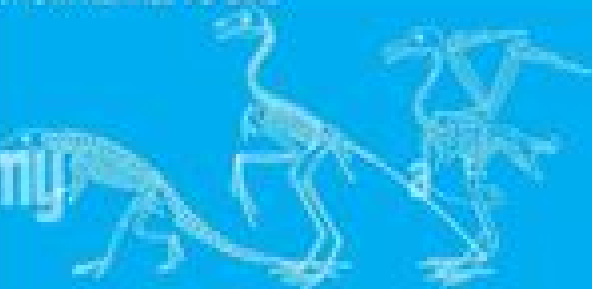

OTHER THEORIES

A second theory says that birds came from the first vertebrates, which were small, worm-like animals. The third and last one claims that they came from the first invertebrates, along with the first plants and animals.

FOSSIL EVIDENCE
The Archaeopteryx has the characteristic of being covered with feathers, while the feathers and the wings are preserved.

THE FOSSIL

There are several fossil specimens found between 1868 and 1912. The first was found in Bavaria, Germany, and very important because it was of the same time of the extinction of "The Dinosaur Species" by Charles Darwin. It is a fossil in which the search for "missing links" is evolution-based.
