*RNA Tumor Viruses, Oncogenes, Human Cancer and AIDS: On the Frontiers of Understanding* Philip Furmanski, Jean Carol Hager, Marvin A. Rich, 2012-12-06 We stand today on the threshold of a new understanding of cancer. Primarily through the powerful tools of molecular biology, unified hypotheses explaining the origins of the disease are emerging and rapidly being validated. This volume, which presents the latest findings from laboratories throughout the world on the role of RNA tumor viruses in cancer, is a celebration of these achievements and a prediction of further progress leading ultimately to the control of the disease. It is important in this context to recall the natural history or life cycle of RNA cancer virology. From the earliest days of the science when viruses were first recognized as distinct biologic agents of etiologic significance, their role in cancer was proposed and hotly debated. The critical early discoveries, even those made as recently as 25 years ago, were met with rejection, not skepticism or cautious restraint, but outright rejection. During the 60s there was a gradual acceptance of the association between viruses and cancer, the result of landmark studies in experimental systems, and this led to a frenzy of activity in the field. There followed another period of doubt and uncertainty due to the difficulty in attempting to apply directly and in retrospect inappropriately the tenets of infectious disease to human cancers, only to have the field resurrected, revitalized, and redirected by the explosion of progress in molecular biology and genetics. *Oncogenes, Aneuploidy, and AIDS* Harvey Bialy, 2004 According to author Harvey Bialy, the work of molecular biologist Peter Duesberg has been grossly distorted by the media and scientific establishments. Until recently, the scientific community, and most notably those from the National Institute for Health, have been unwilling to look at his provocative theories of different causes for cancer and HIV/AIDS. Inspired by UC Berkeley's rare creation of an archive for Duesberg's papers, this book explores Duesberg's early groundbreaking work with viruses and oncogenes, his contentious fights with other scientists, and the profound influence of his life's work.

*Biology of Carcinogenesis* M.J. Waring, B.A. Ponder, 2012-12-06 There is no shortage of books on cancer Why publish another Simply because the subject is important possibly the most important challenge facing medicine today and consequently the focus of one of the fastest growing areas of fundamental biological research The quest to understand and control cancer is so absorbing that from time to time we really need to pause for a moment and try to take stock of the situation Given the sheer breadth of cancer related research that is not an easy task This book together with its planned successors in the series Cancer Biology and Medicine represents our attempt to draw back from the bench or the bedside for a moment and take a slightly longer look at what we are doing what we are trying to do and where we stand It is impossible to be comprehensive or even representative of more than a fraction of relevant knowledge but that is no excuse for not trying to see things in perspective Accordingly we set out to persuade a number of our colleagues to join us in writing a book which might admit a little fresh air into the confined atmosphere within which we mostly work a glimpse perhaps of fresh vistas

*Scientific Directory and Annual Bibliography* National Institutes of Health (U.S.), 1986 *Monoclonal Antibody Therapy of Human Cancer* Kenneth A. Foont, Alton C. Morgan, 2012-12-06 KENNETH A FOONT and ALTON C MORGAN JR Passive immunotherapy using heteroantisera for the treatment of cancer in animals and humans has been studied for over 50 years Attempts have been made to treat animal tumors with sera from immunized syngeneic allogeneic or xenogeneic animals A number of studies of passive immunotherapy using heterologous antisera in humans have also been performed These studies have generally been attempted in patients with large tumor burdens and as would be expected results have been transient at best A wide variety of solid tumors as well as leukemias and lymphomas have been treated with antisera raised in sheep horses rabbits and goats Problems such as anaphylaxis serum sickness and severe cytopenias have been encountered with these antisera There are a number of potential mechanisms by which unconjugated antibodies might be cytotoxic to tumor cells Antibodies bound to the cell surface membrane of tumor cells may lead to cell lysis by complement dependent or antibody dependent cellular cytotoxicity Circulating tumor cells bound by antibody may be more susceptible to phagocytosis by the reticuloendothelial system Antibody bound to the cell surface membrane of tumor cells may enhance immunogenicity of the tumor cell leading to activation of the host's immune system
