Road Vehicle Fuel Economy Energy Paper:

Road Vehicle Fuel Economy M. H. L. Waters, 1992 The large price increases of crude oil in 1974 and 1979 stimulated a search for improved fuel economy for road transport but in the 1980s oil prices declined and interest in fuel saving decreased Now the emission of carbon dioxide from road transport is accepted as one contribution to possible global warming and the vulnerability of oil supplies to political events has been seen in the Middle East Road vehicle fuel economy is again a topical subject *Cost, Effectiveness, and Deployment of Fuel Economy Technologies for Light-Duty Vehicles* National Research Council, Division on Engineering and Physical Sciences, Board on Energy and Environmental Systems, Committee on the Assessment of Technologies for Improving Fuel Economy of Light-Duty Vehicles, Phase 2, 2015-09-28 The light duty vehicle fleet is expected to undergo substantial technological changes over the next several decades New powertrain designs alternative fuels advanced materials and significant changes to the vehicle body are being driven by increasingly stringent fuel economy and greenhouse gas emission standards By the end of the next decade cars and light duty trucks will be more fuel efficient weigh less emit less air pollutants have more safety features and will be more expensive to purchase relative to current vehicles Though the gasoline powered spark ignition engine will continue to be the dominant powertrain configuration even through 2030 such vehicles will be equipped with advanced technologies materials electronics and controls and aerodynamics And by 2030 the deployment of alternative methods to propel and fuel vehicles and alternative modes of transportation including autonomous vehicles will be well underway What are these new technologies how will they work and will some technologies be more effective than others Written to inform The United States Department of Transportation s National Highway Traffic Safety Administration NHTSA and Environmental Protection Agency EPA Corporate Average Fuel Economy CAFE and greenhouse gas GHG emission standards this new report from the National Research Council is a technical evaluation of costs benefits and implementation issues of fuel reduction technologies for next generation light duty vehicles *Cost Effectiveness and Deployment of Fuel Economy Technologies for Light Duty Vehicles* estimates the cost potential efficiency improvements and barriers to commercial deployment of technologies that might be employed from 2020 to 2030 This report describes these promising technologies and makes recommendations for their inclusion on the list of technologies applicable for the 2017 2025 CAFE standards *Energy Conservation Update*, 1981

Watt Committee on Energy Publications: Towards an Energy Policy for Transport Watt Committee on Energy Publications, 2003-09-02 The importance of energy for transport was recognised in Report No 1 published by The Watt Committee on Energy in 1977 Two features of transport energy use are its magnitude approximately 22% of the UK total and its vulnerability to oil supplies nearly 50% of our oil supply There have been several excellent conferences elsewhere since then on new technology and the future designs of aircraft ships and railway trains but there seemed a need to consider all transport modes together In assessing substitution of energy sources there is a tendency also to consider substitution of

transport modes but this is a complex matter and such substitutions will be slow and generally costly. There are historic instances of such changes e.g. from sail to steam at sea in the 19th Century from coal to oil on the railways in the 1950s and from petrol engine aircraft to kerosene powered jets in the 50s and 60s. Such changes take place over a time span of decades. Some transport vehicles have a normal replacement time of 30 years, a few longer still, hence it is a vital matter to match any major transport response to future energy changes to the appropriate time scale.

Kinetic Energy Recovery Systems for Racing Cars Alberto Boretti, 2013-04-02. A kinetic energy recovery system (KERS) captures the kinetic energy that results when brakes are applied to a moving vehicle. The recovered energy can be stored in a flywheel or battery and used later to help boost acceleration. KERS helps transfer what was formerly wasted energy into useful energy. In 2009 the Federation Internationale de l'Automobile (FIA) began allowing KERS to be used in Formula One (F1) competition. Still considered experimental, this technology is undergoing development in the racing world but has yet to become mainstream for production vehicles. The introduction of this book details the theory behind the KERS concept. It describes how kinetic energy can be recovered and the mechanical and electric systems for storing it. Flybrid systems are highlighted since they are the most popular KERS developed thus far. The KERS of two racing vehicles are profiled: the Dyson Lola B12/30 and Audi R18 e-tron quattro. Four SAE technical papers follow the preface and focus on the use of KERS technology in F1 racing. The first paper examines the factors that influence hybrid performance and enable optimization for different racing circuits. The second paper describes a Flybrid KERS designed for the 2009 F1 season. The third paper considers the development of an electric KERS for the 2009 F1 season. The fourth paper presents the challenges and opportunities of the 2014 F1 engine and powertrain rules, particularly as they pertain to KERS. This book has been published for automotive engineers who are interested in hybrid systems, energy recovery, regenerative braking, and improving acceleration. It will also be useful for powertrain designers, researchers, academics, and motorsports professionals, race engineers, team managers, and technology practitioners who design and build racing powertrains.
