Mhc Molecules:

MHC Molecules: Expression, Assembly and Function Robert G. Urban, Roman M. Chicz, 2012-12-06 3 nant expression systems have been used to make MHC molecules containing a single peptide of interest To date fifteen single peptide class I structures incorporating three different HLA and two different H 2 allotypes isotypes and four additional class II structures two single peptide complexes and two superantigen complexes have been reported These advances have enabled us to study the atomic detail of antigen presentation and the general mechanisms behind peptide binding and begin to construct models of T cell recognition Another area of research which has exploded over the past five years has been the identification of MHC associated peptides There are several methods one can use to determine the sequence identity of MHC restricted peptides Historically the most successful technique albeit crude and encumbered with serious limitations has been the use of overlapping synthetic peptides and T cell clones Unfortunately this method absolutely requires i knowledge of the target antigen ii availability of T cell clones and iii a relatively short overall length for the target source protein such that a set of overlapping peptides can be affordably synthesized Briefly the entire sequence of the target protein is chemically synthesized using overlapping peptides which are then screened for biological activity using standard T cell presentation assays Despite its limitations this method was used to identify the first immunodominant epitopes reported in the literature and continues to be used successfully today

The HLA System in Clinical Transplantation Bjarte G.
