Recent Advances In Diagnostic Neuroradiology:

Recent Advances in Diagnostic Neuroradiology Ph. Demaerel, 2014-10-03 **Recent Advances in Diagnostic Neuroradiology**, 1975 Cerebrovascular Bibliography, 1976-10 **Current Catalog** National Library of Medicine (U.S.), First multi year cumulation covers six years 1965-70 **Cumulated Index Medicus**, 1976 **Focal Liver Lesions** Riccardo Lencioni, Dania Cioni, Carlo Bartolozzi, 2005-08-05 Few fields of medicine have witnessed such impressive progress as the diagnosis and treatment of liver tumors Advances in imaging technology the development of novel contrast agents and the introduction of optimized scanning protocols have greatly facilitated the non invasive detection and characterization of focal liver lesions Furthermore image guided techniques for percutaneous tumor ablation have become an accepted alternative treatment for patients with inoperable liver cancer This book provides a comprehensive and up to date overview of the role of diagnostic and interventional radiology in respect of liver tumors The volume moves from background sections on methodology and segmental liver anatomy to the main sections on the diagnosis of benign and malignant liver lesions An integrated approach focused on the correlation of ultrasound CT and MR imaging findings is presented Finally a full section describes the principles methods and results of percutaneous tumor ablation techniques Contrast Media in Ultrasonography Emilio Quaia, 2005-10-28 This book provides a comprehensive account of the physical basis and the clinical applications of microbubble based contrast agents The principles underlying the use of specialized contrast specific imaging techniques and the examination methodology are clearly described The different clinical applications of microbubble based agents are extensively explained with the aid of numerous high quality illustrations many of which are in color In addition research and therapeutic perspectives are addressed All of the chapters are written by recognized experts in the field ensuring that this volume will be of great value to everyone who has an interest in microbubble based contrast agents from physicists and researchers to clinical radiologists **Clinical Cardiac MRI** Jan Bogaert, Steven Dymarkowski, Andrew M. Taylor, 2005-08-31 MRI has become the preferred noninvasive imaging modality for the heart and great vessels The substantial technological progress achieved in recent years has provided the user with state of the art MRI systems but their optimal use can be limited by restricted awareness of the potential patient benefit and the necessity for teaching This extensively illustrated volume has been specifically compiled to meet these needs Essential theoretical background information is provided and imaging acquisition and potential pitfalls are considered in detail Most importantly structured guidelines are provided on the interpretation of clinical data in the wide range of cardiac pathology that can be encountered Throughout the emphasis is on the implementation of cardiac MRI in clinical practice **CURED I - LENT Late Effects of Cancer Treatment on Normal Tissues** Philip Rubin, L.S. Constine, Lawrence B. Marks, Paul Okunieff, 2007-12-27 The rapid advances in radiation oncology radiation biology and radiation therapy physics have led to an accumulation of information on the interactions of radiation with other therapeutic modalities such as the wide array of chemotherapeutic agents being

employed in combination with radiation therapy as well as the multiple biologic response modifiers that are being used in combination with radiation therapy. It is now recognized that they have a significant impact on normal tissue toxicities. The radiation doses customarily deemed safe on the basis of past experience have now when combined with other modalities led to severe late effects in different vital organs. The previously defined radiation tolerance dosages remain as valuable guides but their applicability has changed significantly. The emphasis is now placed on the volume of the organ irradiated as well as the dose being used. New constructs relating global whole organ and focal partial volume injury as a function of the dose volume histogram emerge as a significant predictor of late effects on normal tissues. There are now mathematical models such as the model on standard dose time dose factors and accumulated radiation effects that have been supplanted by linear quadratic equations using the alpha beta ratio and its clinical applicability to normal tissue complications. This volume presents contemporary data relating to late effects on normal tissues.

Imaging of Brain Tumors with Histological Correlations

Antonios Drevelegas, 2013-04-17. The purpose of this book is to bring a new understanding to bear on the diagnosis of brain tumors by linking radiographic image characteristics to the underlying pathology. Brain tumors are relatively uncommon compared with other neoplasms e.g. lung, breast, gastrointestinal. They require special study however since they are pathologically complicated, difficult to diagnose and account for high morbidity. Although many excellent neuroradiological books have been written, few of them focus especially on the diagnosis of brain tumors. In this book, brain tumors are discussed in detail. Special emphasis is placed on CT and MRI findings in relation to the pathology of each tumor. As pathology is the mother of radiology, this approach may be the best way to understand in depth the imaging manifestations of brain tumors. The illustrative examples herein were chosen on the basis of their clarity or complexity, their teachability and their significance for diagnosis and treatment.
