

Mechanical Properties of Solids.

- **Mechanical Properties:** Mechanical properties are essential characteristics of solids that determine their behavior when subjected to external forces. Understanding these properties is crucial for engineering and materials science.
- **Stress and Strain:** Stress is the internal resistance of a material to deformation under an applied force, while strain is the relative change in shape or size of the material. Stress and strain are fundamental parameters for studying mechanical properties.
- **Elastic Deformation:** Elastic deformation is temporary deformation, and the material returns to its original shape when the applied force is removed. Hooke's Law, which states that stress is directly proportional to strain within the elastic limit, applies.
- **Plastic Deformation:** Plastic deformation is permanent deformation, and the material does not return to its original shape. It occurs when the applied force exceeds the elastic limit of the material.
- **Young's Modulus (Y):** Young's modulus is a measure of a material's stiffness or its ability to resist elongation under tension or compression. It is defined as the ratio of stress to strain in the linear elastic region of the stress-strain curve.
