Toward Anti-Adhesion Therapy for Microbial Diseases Itzhak Kahane,Itzhak Ofek,2012-12-06 The emergence of pathogens resistant to conventional antimicrobial agents has forced us to intensify the efforts in search for new approaches to prevent infectious diseases Such a direction was indicated in studies over the last two decades showing that adhesion of pathogens

primarily via glycoconjugate or protein receptors of the host tissue is crucial for the infectious process. Moreover, it was found that infection can be prevented by blocking adhesion of the pathogen to mucosal surfaces of the host. The various aspects of interference with the process of microbial adhesion as a way of preventing diseases were the subject of the Bat Sheva Seminar Towards Anti Adhesion Therapy of Microbial Infectious Diseases held in Zichron Yaakov, Israel, February 25 to March 1, 1996. A major aim of the Bat Sheva de Rothschild Foundation for the Advancement of Science in Israel, which sponsors a series of seminars, ours among them, is to provide the necessary tools and settings for international forums and exposure of young scientists and promising students to the state of the art of the field. This goal has been achieved during the week's discussions, and its major aspects are presented in this compendium. The seminar's participants as well as the readers of this book thank the founder and Foundation for their support. This book includes the major themes of this rapidly growing area. However, by no means do we intend to cover every bit and piece in it. The book's first section deals with the lectin-sugar interactions and their inhibitors.

Clinical Trials of Genetic Therapy with Antisense DNA and DNA Vectors Eric Wickstrom, 2020-08-13. An important new collection of clinical and preclinical reports on genetic therapy; this book describes illustrative examples of diseases in which gene-based interventions are presently plausible and presents case studies of current research using both synthetic oligonucleotides and biological vectors. Combining the insights of over 50 contributors, *Clinical Trials of Genetic Therapy with Antisense DNA and DNA Vectors* furnishes a historical overview of genetic therapy, highlights official Food and Drug Administration positions on the preparation of oligonucleotides and vectors, offers practical models of agent preparation, animal testing, pharmacokinetics, toxicology, and clinical trials, discusses both synthetic DNA and biological vector approaches to cancer, viral, and cardiological indications, illustrates for new practitioners how each stage of genetic therapy is developed, details genetic treatment of leukemia, lymphoma, cancer of the brain, breast, colon, kidney, and lung, melanoma, HIV, and coronary restenosis, includes examples of antisense, ribozyme, tumor suppressor, immunostimulation, and gene replacement therapy, and addresses questions of preparation, delivery, toxicity, mechanism, and specificity.

Noninvasive Mechanical Ventilation in High Risk Infections, Mass Casualty and Pandemics Antonio M. Esquinas, 2023-07-04. The second edition of this book describes the clinical indications of NIV in patients hospitalized with high risk infections as well as in the prehospital management of mass casualty incidents including chemical or biological disasters and pandemics. In recent decades we have learned the impact that different pandemics and mass casualty disasters can outcome in terms of health resource use, health costs, and human lives. The development of respiratory failure in these patients, either infectious or non-infectious causes, has led to develop employment plans related both to invasive or noninvasive mechanical ventilation during acute respiratory failure. In this book, authors evaluate a rational basis for indications specific noninvasive mechanical ventilation indications in hospitalized patients, tuberculosis, bacterial virus, etc. and prehospital applications, mass casualty, chemical, biological disaster equipment, ventilators, interfaces, and plan.

Wolff,2012-12-06 During the first half century of genetics coinciding with the first half of this century geneticists dreamt of the repair of genetic disease by altering or replacing defective genes H J Muller wrote of the great advantages of mutations nanoneedles in his apt term for delicately probing physiological and chemical processes In the same spirit genes could be used to provide treatments of needle point delicacy Yet during this period no realistic possibility appeared it remained but a dream The situation changed abruptly at the half century Microbial genetics and its offshoot cell culture genetics provided the route Pneumococcus transformation showed that exogenous DNA could become a permanent part of the genome yet attempts to reproduce this in animals produced a few tantalizing hints of success but mostly failures Transduction using a virus as mediator offered a better opportunity The first reproducible in vivo gene therapy in a whole animal came in 1981 This was in Drosophila with a transposable element as carrier Flies were cured of a mutant eye color by incorporation of the normal allele and the effect was transmissible foreshadowing not only somatic but germ line gene therapy At the same time retroviruses carrying human genes were found to be extremely efficient in transferring their contents to the chromosomes of cultured cells Immunology of Infection J.G.
