

PLATE II

Types of Nucleus (Normal and Barred Spindle)

The sequence of spirals is double, one branch containing some open, the other containing barred spirals. Each branch is subdivided into sections, designated by the subscripts, a , b , and c , to the right of SN , and described as early, intermediate and late, from a basal spirals. Positions in each branch are determined by the amount of material in the arms relative to that in the earliest region, by the amount of the arms and by the degree of resolution. The early series (a , and the $SN_{1/2}$) appear to be closely related to the helical (H) spirals. The $SN_{1/2}$ transition from H to SN , is smooth and continuous but that from SN to $SN_{1/2}$ may be subabrupt—all known examples of SN have fully developed arms.

The complete sequence of regular nebulae, 10 to 3, which are features which vary systematically throughout the entire map. The luminosities (absolute magnitudes) remain approximately constant as diameters increase and hence surface brightness decreases; with spectral types, and degree of resolution, which characterizes its nebular type, also changes continuously. The picture system is primarily a late type normal spiral.
