Matter of Mind Kenneth M. Heilman, 2002-01-24 Most of what has been learned about how the brain mediates behavior comes from experiments of nature where a stroke or other damage to the brain produces changes in a person's behavior. In Matter of Mind one of the leading figures in behavioral and cognitive neurology uses patient vignettes and other examples from his rich professional life to show just how much knowledge about brain functions such as reading writing language control of emotions skilled movement perception attention and motivation has been gained from the study of patients with diseases of or damage to the brain. No knowledge of neurology or neuroscience is required to understand the book which is intended for neurological patients and their families. It will also be of interest to professionals who study the brain or treat patients with brain damage including neuropsychologists neurologists neuroscientists psychologists psychiatrists speech pathologists occupational and physical therapists and their students and trainees. Dynamic Patterns J. A. Scott Kelso, 1995 foreword by Hermann Haken For the past twenty years Scott Kelso's research has focused on extending the physical concepts of self organization and the mathematical tools of nonlinear dynamics to understand how human beings and human brains perceive, intend, learn, control and coordinate complex behaviors In this book Kelso proposes a new general framework within which to connect brain, mind and behavior Kelso's prescription for mental life breaks dramatically with the classical computational approach that is still the operative framework for many newer psychological and neurophysiological studies His core thesis is that the creation and evolution of patterned behavior at all levels from neurons to mind is governed by the generic processes of self organization Both human brain and behavior are shown to exhibit features of pattern forming dynamical systems including multistability, abrupt phase transitions, crises and intermittency *Dynamic Patterns* brings together different aspects of this approach to the study of human behavior using simple experimental examples and illustrations to convey essential concepts, strategies and methods with a minimum of mathematics Kelso begins with a general account of dynamic pattern formation He then takes up behavior focusing initially on identifying pattern forming instabilities in human sensorimotor coordination Moving back and forth between theory and experiment he establishes the notion that the same pattern forming mechanisms apply regardless of the component parts involved: parts of the body, parts of the nervous system, parts of society and the medium through which the parts are coupled Finally, employing the latest techniques to observe spatiotemporal patterns of brain activity, Kelso shows that the human brain is fundamentally a pattern forming dynamical system poised on the brink of instability Self organization thus underlies the cooperative action of neurons that produces human behavior in all its forms

Neuroimaging: Translating Research into Clinical Utility

André Schmidt, Stefan Borgwardt, 2016-11-02 Psychiatric imaging needs to move away from simple investigations of the neurobiology underling the early phases of psychiatric diseases to translate imaging findings in the clinical field targeting clinical outcomes including transition remission and response to preventative interventions This research topic aims to bring psychiatric neuroimaging studies towards translational impacts in clinical practice suggesting that brain abnormalities may be of potential use for detecting clinical outcomes as treatment response First generation psychiatric neuroimaging focused on simple structural brain alterations associated with the neurobiology of the illness These early studies adopted imaging methods mainly including computerized tomography CT to investigate brain size Second generation psychiatric neuroimaging studies benefited from more sophisticated techniques which included structural methods sMRI coupled with whole brain automated methods voxel based morphometry VBM white matter methods diffusion tensor imaging DTI and tractography functional methods functional magnetic resonance imaging fMRI and advanced neurochemical imaging PET techniques addressing receptor bindings and pre post synaptic functions magnetic resonance spectroscopy MRS and sophisticated meta analytical imaging methods However no consistent or reliable anatomical or functional brain alterations have been univocally associated with any psychiatric disorder and no clinical applications have been developed in psychiatric neuroimaging There is thus urgent need of psychiatric imaging to move towards third generation paradigms In this research topic these novel neuroimaging studies here requested to move away from simple investigations of the neurobiology to translate imaging findings in the clinical field targeting longitudinal outcomes including transition remission and response to preventative interventions With respect to methods the most recent neuroimaging approaches e g structural and functional MRI EEG DTI spectroscopy PET are welcome Third generation psychiatric imaging studies including multimodal approaches multi center analyses mega analyses effective connectivity dynamic causal modelling support vector machines structural equation modelling or graph theory analysis are highly appreciated Furthermore these third generation imaging studies may benefit from the incorporation of new sources of neurobiological information such as whole genome sequencing proteomic lipidomic and expression profiles and cellular models derived from recent induced pluripotent stem cells research We collect Original Research Reviews Mini Reviews Book Review Clinical Case Study Clinical Trial Editorial General Commentary Hypothesis Theory Methods Mini Opinion Perspective and Technology Report from international researcher and clinicians in this field The purpose of this research topic is intended to provide the field with current third generation neuroimaging approaches in translational psychiatry that is hoped to improve and create therapeutic options for psychiatric diseases

The Origins of Creativity Bruce Adolphe, 2001 The exploration of creativity used to be confined to the domains of psychology and philosophy This has changed greatly in recent years with the dramatic advances of modern neuroscience and our greatly improved understanding of higher brain function This book examines the biology of the brain and creativity not only through psychology and philosophy but also with the input of art science and neurobiology for the first time bringing the discoveries of modern neurobiology to bear on the subject of creativity It addresses four themes central to our understanding of creativity the creative experience in art and science the mind's perception of patterns the biological basis of imagination and the influence of the environment of creative powers In this fascinating and interdisciplinary collection of essays painters and composers explore the creative processes in their arts a mathematician points out that computer generated fractal images are often perceived as art and evoke emotional reactions and modern neuroscience begins to explain the creator's experience and sees creative decision making as a function that is inseparable from emotion Not only are these essays fascinating within themselves but they interact and collide in such a way that suddenly mathematics is bringing forth art and science becomes an argument for unexplainable emotions Many questions and theories are explored in these pages What is the Eureka experience how do the brain and mind make creative decisions and what is the role of emotion In the end *The Origins of Creativity* will explore with you the possibility of creativity being a genetically encoded product of the evolution of the brain favored by natural selection but influenced by the environment of each individual as it unifies traditional views on creativity with today's new sciences of the mind
