Management of Periprosthetic Joint Infection Klaus-Dieter Kühn, 2017-09-29 Periprosthetic joint infection (PJI) is among the most serious complications in the field of endoprosthetics. The number of PJIs is increasing worldwide and poses a real interdisciplinary challenge for everyone involved. For the patient concerned, it is necessary to promptly work out an adequate therapy solution to fight off the infection. Both the clinical experience of the surgeon and the proper diagnostic processes are prerequisite for the reliable detection and identification of an infection. The microbiologist is responsible for identifying the causative germs by screening the patient's synovial fluid and tissue samples. Based on the findings and subsequent resistance testing, the infectious disease specialist can recommend the appropriate antibiotic therapy. Furthermore, the clinical pharmacist is consulted regularly throughout the therapy to discuss the risk of potential drug interactions. The surgeon will proceed with the revision surgery following defined algorithms. Adequate radical debridement of infected and necrotic surrounding tissue is the most important step towards a successful cure of the infection.

Accompanying the surgery anti infective agents are given systemically and locally While systemic application of anti infectives mainly reduces the number of haematogenic spreading planktonic germs local application immediately forms a colonization barrier and protects the implant from sessile biofilm formation Concurrently antibiotics are actively released from the implant resulting in local germ reduction Thus local agents are embedded in the concept of surgical PJI treatment as a reliable adjuvant measure and they sustainably support the successful outcome In one stage procedures local agents are released from specialized antibiotic loaded bone cements while in two or multi stage procedures local agents are released from corresponding temporary spacers interim prostheses Even from an economic standpoint the combination of systemic and local agent application is meaningful Furthermore there are some interesting trends towards the coating of metallic implants to protect against biofilm formation on the implant surface On the basis of their personal experience specialists from all over the world present explain and discuss preventive approaches appropriate diagnostic strategies for detection reproducible effective surgical treatments as well as the economic impact of PJI The reader can use this book as a solid platform for comparing their own approach to PJI treatment with the specialists recommendations *Turek's Orthopaedics* Stuart L.
