**Atmospheric Thermodynamics** Craig Bohren, Bruce Albrecht, 2023-05-05 Atmospheric Thermodynamics provides a comprehensive treatment of a subject that can often be intimidating. The text analyses real life problems and applications of the subject alongside of guiding the reader through the fundamental basics and covering the first and second laws and the ideal gas law followed by an emphasis on moist processes in Earth's atmosphere. Water in all its phases is a critical component of weather and the Earth's climate system. With user friendly chapters that include energy conservation and water and its transformations the authors write with a willingness to expose assumptions and approximations usually absent in other textbooks. History is woven into the text to provide a context for the time evolution of thermodynamics and its place in atmospheric science and demonstrating how physical reasoning leads to correct explanations of everyday phenomena. Many of the experiments described were done using inexpensive instruments to take advantage of the earth's atmosphere as a freely accessible thermodynamics library. This second edition provides updated treatments of atmospheric measurements and substantially expanded sections that include atmospheric applications of the first and second laws and energy exchange between humans and their atmospheric environment. With 400 thought provoking problems and 350 references with annotated notes and further reading suggestions this second edition provides a basic understanding of the fundamentals of this subject while still being a comprehensive reference guide for those working in the field of atmospheric and environmental sciences. SD Times. *Computation, Physics and Beyond* Michael J. Dinneen, Bakhadyr Khoussainov, Prof. Andre Nies, 2012-02-15. This Festschrift volume has been published in honor of Cristian Calude on the occasion of his 60th birthday and contains contributions from invited speakers and regular papers presented at the International Workshop on Theoretical Computer Science, WTCS 2012 held in Auckland, New Zealand in February 2012. Cristian Calude has made a significant contribution to research in computer science theory. Along with early work by Chaitin, Ku, era Kurtz, Solovay and Terwijn, his papers published in the mid 1990s jointly with Khoussainov, Hertling and Wang laid the foundation for the development of modern theory of algorithmic randomness. His work was essential for establishing the leading role of New Zealand in this area. The research interests of Cristian Calude are reflected in the topics covered by the 32 papers included in this book: namely algorithmic information theory, algorithms, automata and formal languages, computing and natural sciences, computability and applications, logic and applications, philosophy of computation, physics and computation, and unconventional models of computation. They have been organized into four parts. The first part consists of papers discussing his life achievements. This is followed by papers in the three general areas of complexity, computability and randomness, physics, philosophy and logic, and computation and algorithms, automata and formal models including unconventional computing.
