**Mathematics Elsewhere** Marcia Ascher, 2018-06-05 Mathematics Elsewhere is a fascinating and important contribution to a global view of mathematics. Presenting mathematical ideas of peoples from a variety of small scale and traditional cultures it humanizes our view of mathematics and expands our conception of what is mathematical. Through engaging examples of how particular societies structure time, reach decisions about the future, make models and maps, systematize relationships and create intriguing figures, Marcia Ascher demonstrates that traditional cultures have mathematical ideas that are far more substantial and sophisticated than is generally acknowledged. Malagasy divination rituals, for example, rely on complex algebraic algorithms. And some cultures use calendars far more abstract and elegant than our own. Ascher also shows that certain concepts assumed to be universal—that time is a single progression, for instance, or that equality is a static relationship—are not. The Basque notion of equivalence, for example, is a dynamic and temporal one not adequately captured by the familiar equal sign. Other ideas taken to be the exclusive province of professionally trained Western mathematicians are in fact shared by people in many societies. The ideas discussed come from geographically varied cultures including the Borana and Malagasy of Africa, the Tongans and Marshall Islanders of Oceania, the Tamils of South India, the Basques of Western Europe, and the Balinese and Kodi of Indonesia. This book belongs on the shelves of mathematicians, math students, and math educators, and in the hands of anyone interested in traditional societies or how people think. Illustrating how mathematical ideas play a vital role in diverse human endeavors, from navigation to social interaction to religion, it offers through the vehicle of mathematics unique cultural encounters to any reader.     **Catalog of Copyright Entries. *BASIC Microcomputing and Biostatistics* Donald W. Rogers, 2012-12-06 BASIC Microcomputing and Biostatistics is designed as the first practical how-to guide to both computer programming in BASIC and the statistical data processing techniques needed to analyze experimental, clinical, and other numerical data. It provides a small vocabulary of essential computer statements and shows how they are used to solve problems in the biological, physical, and medical sciences. No mathematical background beyond algebra, and an inkling of the principles of calculus, is assumed. All more advanced mathematical techniques are developed from scratch before they are used. The computing language is BASIC, a high-level language that is easy to learn and widely available using time-sharing computer systems and personal microcomputers. The strategy of the book is to present computer programming at the outset and to use it throughout. BASIC is developed in a way reminiscent of graded readers used in human languages: the first programs are so simple that they can be read almost without an introduction to the language. Each program thereafter contains new vocabulary and one or more concepts.

explained in the text not used in the previous ones By gradual stages the reader can progress from programs that do nothing more than count from one to ten to sophisticated programs for nonlinear curve fitting matrix algebra and multiple regression There are 33 working programs and except for the introductory ones each performs a useful function in everyday data processing problems encountered by the experimentalist in many diverse fields **The American Mathematical Monthly**
