The goal of this book is to present basic optimization theory and modern computational algorithms in a concise manner The book is suitable for undergraduate and graduate students in all branches of engineering operations research and management information systems The book should also be useful for practitioners who are interested in learning optimization and using these techniques on their own Most available books in the field tend to be either too theoretical or present computational algorithms in a cookbook style An approach that falls somewhere in between these two extremes is adopted in this book Theory is presented in an informal style to make sense to most undergraduate and graduate students in engineering and business Computational algorithms are also developed in an informal style by appealing to readers intuition rather than mathematical rigor The available computationally oriented books generally present algorithms alone and expect readers to perform computations by hand or implement these algorithms by themselves This obviously is unrealistic for a usual introductory optimization course in which a wide variety of optimization algorithms are discussed There are some books that present programs written in traditional computer languages such as Basic FORTRAN or Pascal These programs help with computations but are of limited value in developing understanding of the algorithms because very little information about the intermediate steps v Preface VI is presented      Operations Research in Progress Gustav Feichtinger, P.

Pritchard, 2014-05-18 Control of Distributed Parameter Systems covers the proceedings of the Second IFAC Symposium Coventry held in Great Britain from June 28 to July 1 1977 The book focuses on the methodologies processes and techniques in the control of distributed parameter systems including boundary value control digital transfer matrix and differential equations The selection first discusses the asymptotic methods in the optimal control of distributed systems applications of distributed parameter control theory of a survey and dual variational inequalities for external eigenvalue problems The book also ponders on stochastic differential equations in Hilbert space and their application to delay systems and linear quadratic optimal control problem over an infinite time horizon for a class of distributed parameter systems The manuscript investigates the semigroup approach to boundary value control and stability of nonlinear distributed parameter systems Topics include boundary control action implemented through a dynamical system classical boundary

value controls stability of nonlinear systems and feedback control on the boundary The text also focuses on the functional analysis interpretation of Lyapunov stability method of multipliers for a class distributed parameter systems and digital transfer matrix approach to distributed system simulation The selection is a dependable source of data for readers interested in the control of distributed parameter systems      Catalog of Copyright Entries.
