Mathematical Topics In Fluid Mechanics:

Mathematical Topics in Fluid Mechanics: Volume 2: Compressible Models Pierre-Louis Lions, 1996 Fluid mechanics models consist of systems of nonlinear partial differential equations for which despite a long history of important mathematical contributions no complete mathematical understanding is available The second volume of this book describes compressible fluid mechanics models The book contains entirely new material on a subject known to be rather difficult and important for applications compressible flows It is probably a unique effort on the mathematical problems associated with the compressible Navier Stokes equations written by one of the world's leading experts on nonlinear partial differential equations Professor P L Lions won the Fields Medal in 1994

Mathematical Topics in Fluid Mechanics Jose Francisco Rodrigues, Adelia Sequeira, 2020-09-30 This Research Note presents several contributions and mathematical studies in fluid mechanics namely in non Newtonian and viscoelastic fluids and on the Navier Stokes equations in unbounded domains It includes review of the mathematical analysis of incompressible and compressible flows and results in magnetohydrodynamic and electrohydrodynamic stability and thermoconvective flow of Boussinesq Stefan type These studies along with brief communications on a variety of related topics comprise the proceedings of a summer course held in Lisbon Portugal in 1991 Together they provide a set of comprehensive survey and advanced introduction to problems in fluid mechanics and partial differential equations

Mathematical Topics in Fluid Mechanics: Volume 1: Incompressible Models Pierre-Louis Lions, 1996-06-27 One of the most challenging topics in applied mathematics over the past decades has been the development of the theory of nonlinear partial differential equations Many of the problems in mechanics geometry probability etc lead to such equations when formulated in mathematical terms However despite a long history of contributions there exists no central core theory and the most important advances have come from the study of particular equations and classes of equations arising in specific applications This two volume work forms a unique and rigorous treatise on various mathematical aspects of fluid mechanics models These models consist of systems of nonlinear partial differential equations like the incompressible and compressible Navier Stokes equations The main emphasis in Volume 1 is on the mathematical analysis of incompressible models After recalling the fundamental description of Newtonian fluids an original and self contained study of both the classical Navier Stokes equations including the inhomogeneous case and the Euler equations is given Known results and many new results about the existence and regularity of solutions are presented with complete proofs The discussion contains many interesting insights and remarks The text highlights in particular the use of modern analytical tools and methods and also indicates many open problems Volume 2 will be devoted to essentially new results for compressible models Written by one of the world's leading researchers in nonlinear partial differential equations Mathematical Topics in Fluid Mechanics will be an indispensable reference for every serious researcher in the field Its topicality and the clear concise and deep presentation by the author make it an outstanding contribution to the great theoretical problems in science concerning
