Decision Making and Programming V. V. Kolbin, 2003 The problem of selection of alternatives or the problem of decision making in the modern world has become the most important class of problems constantly faced by business people researchers doctors and engineers The fields that are almost entirely focused on conflicts where applied mathematics is successfully used are law military science many branches of economics sociology political science and psychology There are good grounds to believe that medicine and some branches of biology and ethics can also be included in this list Modern applied mathematics can produce solutions to many tens of classes of conflicts differing by the composition and structure of the participants specific features of the set of their objectives or interests and various characteristics of the set of their actions strategies behaviors controls and decisions as applied to various principles of selection or notions of decision optimization The current issues of social and economic systems involve the necessity to coordinate and jointly optimize various lines of development and activities of modern society For this reason the decision problems arising in investigation of such systems are versatile which shows up not only in the multiplicity of participants their interests and complexity of reciprocal effects but also in the laborious development of social utility criteria for a variety of indices and versatile objectives The efficient decision methods for such complex systems can be developed only the basis of specially developed mathematical tools

Decisions, Uncertainty, and the Brain Paul W. Glimcher, 2004-09-17 In this provocative book Paul Glimcher argues that economic theory may provide an

alternative to the classical Cartesian model of the brain and behavior Glimcher argues that Cartesian dualism operates from the false premise that the reflex is able to describe behavior in the real world that animals inhabit A mathematically rich cognitive theory he claims could solve the most difficult problems that any environment could present eliminating the need for dualism by eliminating the need for a reflex theory Such a mathematically rigorous description of the neural processes that connect sensation and action he explains will have its roots in microeconomic theory Economic theory allows physiologists to define both the optimal course of action that an animal might select and a mathematical route by which that optimal solution can be derived Glimcher outlines what an economics based cognitive model might look like and how one would begin to test it empirically Along the way he presents a fascinating history of neuroscience He also discusses related questions about determinism free will and the stochastic nature of complex behavior
