Matrix Metalloproteinases In The Central Nervous System:

Matrix Metalloproteinases In The Central Nervous System Katherine Conant, Paul E Gottschall, 2005-07-26 This book presents the reader with an understanding of the role played by matrix metalloproteinases MMPs in the normal and diseased central nervous system CNS These enzymes may be important to brain development and may also contribute to tissue destruction which is observed with inflammatory and degenerative conditions of the brain The book provides a background on the biology of MMPs and on the stimuli and conditions that are linked to an increase in their production and activity It describes the targets of MMPs which include matrix proteins such as collagen soluble cytokines and chemokines and cell surface receptors Studies implicating MMPs in neuronal process outgrowth and cell migration in CNS development are covered The book also touches on studies suggesting that in certain situations dysregulated MMP activity and or production may be critical to blood brain barrier breakdown and neuronal damage a *Infections of the Central Nervous System* W.

New Perspectives of Central Nervous System Injury and Neuroprotection, 2012-10-22 Central nervous system CNS diseases such as Alzheimer s disease Parkinson s disease and amyotrophic lateral sclerosis affect a large number of populations worldwide for which no suitable cure is currently available In addition stroke nanoparticle intoxication diabetes hypertension and psychostimulant abuse either alone or in combination are capable of inducing potential brain damage Thus there is an urgent need to expand our knowledge to find suitable therapeutic strategies to enhance neurorepair processes in such diseases This volume presents neuroprotection and novel therapeutic strategies developed in the last 5 years by 12 world leaders in the field The term neuroprotection means rescuing neuronal and non neuronal cells together The cerebral endothelium that constitutes the anatomical and physiological site of the blood brain barrier BBB is one of the most important non neural cells in the CNS Any distortion of the BBB leads to brain diseases and restoration of the barrier results in neuroprotection Thus the BBB appears to be the gateway for neurological diseases and neurorepair However to treat brain tumors or infarcts new therapeutic strategies are needed to enhance brain drug delivery using nanotechnology In addition apart from conventional drugs restoration of BBB function could also be achieved by means of antibodies directed against specific proteins neurotransmitters or exogenous supplement of neurotrophic factors Since co morbidity factors e g hypertension diabetes and exposure of nanoparticles could complicate the pathogenesis of neurological disorders either an enhanced dose of the drug or nanodelivery of a combination of several drugs is needed to achieve neuroprotection This volume of International Review of Neurobiology is the first to discuss novel therapeutic strategies in situations of neurological disorders in combination with different co morbidity factors Reviews written by experts in such a way that provides basic knowledge for beginners and advanced information for researchers and experts

Diseases Sajal Chakraborti,Tapati Chakraborti,Naranjan S. Dhalla,2017-07-13 This book bridges the gap between fundamental research and biomedical and pharmacological applications on proteases It represents a comprehensive overview of the multifaceted field of proteases in cellular environment and highlights the recently elucidated functions of complex proteolytic systems in different diseases Several established investigators have elucidated the crucial role of proteases in biological processes including how proteolytic function and regulation can be combined to develop new strategies of therapeutic interventions Proteases form one of the largest and most diverse families of enzymes known It is now clear that proteases are involved in every aspect of life functions of an organism Under physiological conditions proteases are regulated by their endogenous inhibitors however when the activity of proteases is not regulated appropriately disease processes can

result in So there is absolute need for a stringent control of proteolytic activities in cells and tissues Dysregulation of proteases may cause derangement of cellular signalling network resulting in different pathophysiological conditions such as vascular remodelling atherosclerotic plaque progression ulcer and rheumatoid arthritis Alzheimer disease cancer metastasis tumor progression and inflammation Additionally many infective microorganisms require proteases for replication or use proteases as virulence factors which have facilitated the development of protease targeted therapies for a variety of parasitic diseases

Experimental Models of Multiple Sclerosis Ehud Lavi, Cris S.

Constantinescu, 2008-01-03 Multiple Sclerosis MS is an enigmatic immune mediated disease of the central nervous system that affects about 350 000 individuals in the US and many more around the world The mechanism of this disease is largely unknown and there is no cure for it However there are several well characterized experimental animal models that help us understand and speculate about potential mechanisms of pathology in this disease Many of the experimental therapies designed for this disease rely on testing the drugs in animal models before using it in clinical trials This book combines for the first time the different experimental models for MS including immune mediated and viral under one roof and highlights aspects that are different or shared among these experimental models It s aim is to improve our understanding of this devastating disease and help us think about potential additional therapies for it
