

# Organometallic Compounds

An organo metallic compound is generally defined as one that possess a **metal-carbon** bond. The bond is between one or more **carbon atoms of an organic group** or molecule and a metal atom. The organic group may be the alkyl radical or a carbon atom in a molecule. But some non-metal atoms less electronegative than that of carbon can form a direct bond with carbon. For Example B, As, P and Si elements can form bonds directly with carbon and but these are not organo metallic compounds.

The organo metallic linkage can be represented as

methyl chloride

methyllithium

methylmagnesium bromide
