Seagrass Ecology:

Seagrass Ecology Marten A. Hemminga, Carlos M. Duarte, 2000-10-19 Seagrasses occur in coastal zones throughout the world in the part of the marine habitat that is most heavily influenced by humans Decisions about coastal management therefore often involve seagrasses but a full appreciation of the role of seagrasses in coastal ecosystems has yet to be reached This book provides an entry point for those wishing to learn about the ecology of this fascinating group of plants and gives a broad overview of current knowledge complemented by extensive literature references to guide the reader to more detailed studies Seagrasses: Biology, Ecology and Conservation Anthony W. D. Larkum, Robert J. Orth, Carlos

Duarte, 2007-05-16 Seagrasses are unique plants the only group of flowering plants to recolonise the sea They occur on every continental margin except Antarctica and form ecosystems which have important roles in fisheries fish nursery grounds prawn fisheries habitat diversity and sediment stabilisation Over the last two decades there has been an explosion of research and information on all aspects of seagrass biology However the compilation of all this work into one book has not been attempted previously In this book experts in 26 areas of seagrass biology present their work in chapters which are state of the art and designed to be useful to students and researchers alike The book not only focuses on what has been discovered but what exciting areas are left to discover The book is divided into sections on taxonomy anatomy reproduction ecology physiology fisheries management conservation and landscape ecology It is destined to become the chosen text on seagrasses for any marine biology course **Seagrass** Robert S. Pirog, 2011 Seagrasses are flowering plants from one of four plant

families all in the order Alismatales which grow in marine fully saline environments Seagrasses are sometimes labelled ecosystem engineers because they partly create their own habitat the leaves slow down water currents increasing sedimentation and the seagrass roots and rhizomes stabilise the seabed Their importance for associated species is mainly due to provision of shelter and for their extraordinarily high rate of primary production This book presents current research in the study of seagrass including ecosystem modelling of seagrass beds *P. oceanica* population genetics and proteomics the impact of hurricanes on seagrass *Thalassia testudinum* in the Caribbean Sea GIS mapping of seagrass meadows and the rise of *Ruppia* in seagrass beds **Seagrasses: Biology, Ecology and Conservation** Anthony Larkum, Robert J. Seagrasses Stephen A. Climate change poses a severe threat to the global ecosystem which will impact all nations around the world including ASEAN member countries Urgent and integrated effort is critical to reduce the amount of carbon dioxide which traps heat in the atmosphere and causes climate change Plants have the capacity to absorb and store a large amount of carbon Recent researches suggest that seagrass ecosystem is one of the most promising carbon sequester and carbon sink Seagrass absorbs carbon dioxide and converts it into potential energy which is stored in the form of organic carbon The seagrass organic carbon and organic matter from other sources is trapped in the seagrass sediments Due to this capacity seagrass is recognized as a natural carbon dioxide removal NCDR Compared to tropical rainforests seagrass meadows have more potential to capture and store a large amount of carbon i e blue carbon ASEAN countries share similar concerns and equal responsibility to preserve the seagrass ecosystem as a natural based approach on mitigating global climate change However seagrass ecosystem in each of the ASEAN country has its own unique characteristics posing challenges on the contribution assessment of each country Thus a general platform to collect data and calculate carbon sequestration from the seagrass ecosystem needs to be developed to equally compare data and information among the ASEAN countries Accordingly this guideline was developed as a mean to fulfil the need

Coastal Wetlands Gerardo Perillo,Eric Wolanski,Donald R Cahoon,Charles S Hopkinson,2018-11-02 Coastal Wetlands Second Edition An Integrated and Ecosystem Approach provides an understanding of the functioning of coastal ecosystems and the ecological services that they provide As coastal wetlands are under a great deal of pressure from the dual forces of rising sea levels and the intervention of human populations both along the estuary and in the river catchment this book covers important issues such as the destruction or degradation of wetlands from land reclamation and infrastructures impacts from the discharge of pollutants changes in river flows and sediment supplies land clearing and dam operations Covers climate change and its influence on coastal wetland form and function Provides a fully updated and expanded resource including new chapters on modeling management and the impact of climate change Contains full color figures of wetlands and estuaries in different parts of the world

Estuarine Nutrient Cycling: The Influence of Primary Producers Søren Laurentius Nielsen,Gary T. Banta,Morten Foldager Pedersen,2007-11-03 It is a well known fact that eutrophication of coastal waters causes significant changes in the species composition of the primary producers Usually

a shift from an ecosystem dominated by sea grasses or large brown algae to an ecosystem dominated by fast growing green algae or phytoplankton is observed While this shift has been documented in a number of research papers and books the consequences of this shift are less well known This book focuses on the consequences of such changes for nutrient cycling The aim is to investigate how different types of primary producers influence nutrient cycling in coastal marine waters and how nutrient cycling changes qualitatively and quantitatively as a consequence of the changes in the primary producer community caused by eutrophication The various chapters address specific ecological processes such as grazing decomposition burial and export of biomass from the ecosystem The book is intended for researchers and professionals working in the field of coastal marine ecology and estuarine ecology and for advanced students in this field **Science for**

the Protection of Indonesian Coastal Ecosystems (SPICE) Tim C. Jennerjahn,Tim Rixen,Hari Eko Irianto,Joko Samiaji,2021-10-13 Science for the Protection of Indonesian Coastal Ecosystems SPICE provides key information on all aspects related to the management of coastal ecosystems This includes the coastal management involved the ecology of this area and the relationship between humans and the environment found here The book presents guidelines defined by scientific experts allowing for proper application of science products into ecosystem management The bio geo physical importance of coastal ecosystems of Indonesia makes this a book of global importance and interest Written by an Indonesian German author team giving a unique and global perspective on the coastal ecosystems Presents text boxes with research gaps and policy implications giving the reader an easy grasp of what needs to be done in terms of research and management Features best practice case studies that can be applied to coastal ecosystems around the world offered through the lens of Indonesia a region of global relevance in terms of climate and environmental change Marine Ecosystem Restoration (MER) – Challenges and New Horizons Brian Silliman,Avigdor Abelson,Christine Angelini,Gesche Krause,Megan Irene Saunders,Tjisse Van Der Heide,2023-10-23 Worldwide marine ecosystems have been lost and degraded due to anthropogenic disturbances For example oyster reefs have declined by at least 85% coral reefs by 19% seagrasses by 29% North American salt marshes by 42% and mangroves by 35% from the early 19th century Deepwater reefs and deep sea vents are not immune and have also been reduced in extent in many areas Factors driving these losses include habitat destruction pollution invasive species overfishing trawling mining and more recently climate change effects such as ocean warming species range changes and acidification These habitat declines are occurring at a time when marine waters are being used at or near their maximum productive capacity to meet the contemporary needs of an ever increasing human population Because coastal and marine ecosystems generate some of the richest biodiversity hotspots on Earth and provide critical ecosystem services including storm protection fisheries production and carbon storage over 1 billion US dollars have been spent globally in an attempt to halt and reverse observed declines Early conservation efforts aimed at protecting these valuable and threatened habitats focused on reducing human impacts and physical stressors However with habitat degradation continuing and

sometimes increasing in rate it is now clear conservation alone will not be sufficient to protect and reestablish coastal ecosystems Habitat restoration although in existence for many decades has recently been elevated as a new primary strategy to stem and even reverse coastal habitat loss The call for increasing investment in restoration efforts has emerged with significant advances in propagule rearing and dispersion of habitat forming organisms e g oysters seagrasses corals In addition restoration resources are increasingly allocated by governments and or large corporations with the aim to for example fix past landscape engineering efforts that had unintended environmental consequences Such investments are being made to i provide jobs for those unemployed during economic downturns ii restore ecosystems destroyed by natural disasters and stressors iii increase coastal defense in response to increased frequency of intense storms and or iv compensate for pollution and development driven habitat degradation Conservation practitioners have traditionally been skeptical to invest heavily in restoration at large scales because of the high cost per area 10 000 5 000 000 US ha for coastal vs 500 5 000 US ha for terrestrial systems to replant coastal ecosystems and or the high chance that the restored ecosystems will not live long e g outplanted corals For restoration to be effective and employed as a primary method of coastal conservation at relevant scales we must improve its efficiency lower costs and rapidly share and incorporate advances One crucial step will be to identify when and where restoration attempts have been carried out according to state of art ecological theory and gauge their success Another is generating synthesis studies that focus both within and across ecosystems to identify efficiencies adaptations and innovations Work that shows theoretical and methodological innovations in specific ecosystems as well as across systems will be critical to pushing all fields of MER forward Although there is rapidly increasing interest and investment the field of marine ecosystem restoration is just beginning to undergo synthesis Therefore the aim of this Research Topic is to bring together research contributions to help address this synthesis need provide a spotlight for recent innovations enhance our understanding of successful methods in marine ecosystem restoration and promote integration of ecological sociological and engineering theory into restoration practices
