Metabolic Adaptation To Extrauterine Life The Antenatal Role Of Carbohydrates And Energy Metabolism:

Metabolic Adaptation to Extrauterine Life R. de Meyer, 2012-12-06 On December 19 20 and 21 1979 we had the opportunity to organize a Workshop on Antenatal factors affecting metabolic adaptation to extrauterine life Role of carbohydrates and energy metabolism This meeting was made possible thanks to grants from the Committee of Medical Research and Public Health CRM of the Commission of European Communities We want to express our warmest gratitude for the effort that has been made and we hope that the exchange of information between the participants will allow better understanding of the mechanism of adaptation to extrauterine life and that the conclusions drawn will contribute to a better care of the newborn Adaptation to extrauterine life is one of the most important steps in life At the moment of birth numerous conditions are drastically changed and in order to survive the newborn has to rely upon new sources of energy and of substrates This switch over has to occur smoothly and any adaptation failure will result in the disturbance of important metabolic functions Mortality and morbidity in neonatal period remain still very high in comparison with the figures observed later in life the reduction of mortality has been much more important in child and adult than in neonates

Embryogenesis T.V.N. Persaud, 2012-12-06 The study of birth defects has assumed an importance even greater now than in

the past because mortality rates attributed to congenital anomalies have declined far less than those for other causes of death such as infectious and nutritional diseases It is estimated that as many as 50% of all pregnancies terminate as miscarriages In the majority of cases this is the result of faulty development Major congenital malformations are found in at least 2% of all liveborn infants and 22% of all stillbirths and infant deaths are associated with severe congenital anomalies Teratological studies of an experimental nature are neither ethical nor justifiable in humans Numerous investigations have been carried out in laboratory animals and other experimental models in order to improve our understanding of abnormal intrauterine development In less than two decades the field of experimental teratology has advanced phenomenally As a result of the wide range of information that is now accumulating it has become possible to obtain an insight into the causes mechanisms and prevention of birth defects However considerable work will be needed before these problems can be resolved The contributions in this volume include some of the more recent and exciting observations on the cellular and molecular aspects of developmental defects It is not only a documentation of the latest experimental work but it also indicates new and important areas for future research
