Doyle,2001-05-11 Mechanical engineering an engineering discipline born of the needs of the Industrial Revolution is once again asked to do its substantial share in the call for industrial renewal The general call is urgent as we face the profound issues of productivity and competitiveness that require engineering solutions among others The Mechanical Engineering Series is a new series featuring graduate texts and research monographs intended to address the need for information in contemporary areas of mechanical engineering The series is conceived as a comprehensive one that will cover a broad range of concentrations important to mechanical engineering graduate education and research We are fortunate to have a distinguished roster of consulting editors each an expert in one of the areas of concentration The names of the consult

ing editors are listed on page vi The areas of concentration are applied mechanics biomechanics computational mechanics dynamic systems and control energetics mechanics of materials processing thermal science and tribology We are pleased to present *Nonlinear Analysis of Thin Walled Structures* by James F Doyle Austin Texas Frederick F Ling Preface This book is concerned with the challenging subject of the nonlinear static dynamic and stability analyses of thin walled structures It carries on from where *Static and Dynamic Analysis of Structures* published by Kluwer 1991 left off that book concentrated on frames and linear analysis while the present book is focused on plated structures nonlinear analysis and a greater emphasis on stability analysis Large Print Books State Library of Ohio,1982 **Complex Wave Dynamics on Thin Films** Hen-hong Chang,E.A. Demekhin,2002-03-14 Wave evolution on a falling film is a classical hydrodynamic instability whose rich wave dynamics have been carefully recorded in the last fifty years Such waves are known to profoundly affect the mass and heat transfer of multi phase industrial units This book describes the collective effort of both authors and their students in constructing a comprehensive theory to describe the complex wave evolution from nearly harmonic waves at the inlet to complex spatio temporal patterns involving solitary waves downstream The mathematical theory represents a significant breakthrough from classical linear stability theories which can only describe the inlet harmonic waves and also extends classical soliton theory for integrable systems to real solitary wave dynamics with dissipation One unique feature of falling film solitary wave dynamics which drives much of the spatio temporal wave evolution is the irreversible coalescence of such localized wave structures It represents the first full description of a hydrodynamic instability from inception to developed chaos This approach should prove useful for other complex hydrodynamic instabilities and would allow industrial engineers to better design their multi phase apparati by exploiting the deciphered wave dynamics This publication gives a comprehensive review of all experimental records and existing theories and significantly advances state of the art on the subject and are complimented by complex and attractive graphics from computational fluid mechanics **Romance** Grant Martin Overton,1927
