Scientific Progress. A Philosophical Essay on the Economics of Research in Natural Science. NICHOLAS RESCHER. Blackwell, Oxford, and University of Pittsburgh Press, Pittsburgh, 1978. xiv, 278 pp., illus. \$18.95.

Nicholas Rescher prefaces this philosophical essay with the claim that "influential voices sound all around us with predictions of an imminent end to scientific progress." Readers who have not heard the alarm are likely to be surprised by Rescher's insistence that he addresses the question of limits to scientific progress at a time when the scientific community is suffering a "failure of nerve" and a "crisis of self-confidence" reminiscent of what beset the aristocracy on the eve of the French Revolution. Rescher grossly exaggerates its urgency, but the question he raises is nevertheless of considerable interest. His major contribution is to recognize the possibility that limits to the advance of science need not depend on the finitude of nature or on man's capacity to comprehend it. Instead, Rescher argues that the binding constraint on scientific progress is economic; he claims that the technology of producing scientific knowledge is subject to diminishing returns.

Rescher's central concern is to analyze the determinants of the rate of scientific progress. For a philosopher he pays surprisingly little attention to the more fundamental problem of defining what constitutes scientific progress. For purposes of his central argument he simply measures scientific progress by the number of "first-rate findings" in a given time period. This standard begs the obvious question of what is a first-rate finding, but, on the rather strong assumption that this criterion can be made operational, it offers two principal advantages. First, scientific progress is not identified with increase in the total volume of scientific publications; indeed, it is arguable that publications are a better measure of scientific input than of scientific output, since they are a requisite of career advancement rather like education. Second, Rescher's quantitative approach to measuring progress sidesteps the controversial issue of whether scientific knowledge is cumulative. It has become

orthodoxy among philosophers of science that scientific advance is not merely a matter of generalizing older theories to encompass a broader range of phenomena; often new theories annihilate older theories, changing utterly the context in which phenomena are perceived and interpreted. Measuring progress by first-rate discoveries is not inconsistent with this view, since first-rate discoveries may either extend an existing paradigm or overturn one.

Rescher's somewhat simple-minded operational measure seems adequate for his purpose, but he cannot resist the temptation to comment briefly on the deeper issues. He bows grudgingly to Thomas Kuhn by begging the question whether there has been "improvement" in the adequacy of scientific theories to comprehend the world, but he insists that scientific progress can also be understood as improvement in man's control over nature in a technological sense. This conflation of scientific and technological progress is wholly unilluminating.

Rescher seeks to explain the rate of scientific progress by constructing a theoretical model rather similar to models of economic growth. The structure of his model—and lamentably the arbitrariness of his crucial assumptions—suggests that his real source of inspiration was not an imminent crisis in the scientific community but the recent neo-Malthusian literature on the limits to economic growth. Rescher does not assume that the stock of potential scientific discoveries is finite, but he does postulate that the phenomena giving rise to significant findings are distributed logarithmically over parameter space. In other words, as technology extends the range of feasible experimental conditions (higher energy levels, lower temperatures, and so on), the maintenance of a constant flow of additions to the stock of first-rate findings requires a constant flow of order-of-magnitude extensions in the parameter range. While this "findings-distribution" assumption has some intuitive plausibility, Rescher offers no evidence to support it.

A second crucial link in the argument is the assertion that the cost of experimental apparatus rises more than pro-

portionately with extensions in the accessible range of parameter space. This premise, together with the assumption concerning the distribution of findings, suffices to assure that an exponential increase in the resources devoted to science will yield only a linear increase in first-rate findings. Over time a constant exponential growth of resources will thus produce a steady advance of science in the sense of a constant stream of first-rate findings per unit time. Rescher asserts that recent history confirms the validity of this proposition, but his evidence is fragmentary and not particularly compelling.

The final step of the argument is the most troublesome. Rescher simply assumes that economic growth will cease, and therefore that the resources annually devoted to scientific inquiry will reach an upper bound. Under such conditions, the prior two assumptions compel the conclusion that first-rate findings will be distributed logarithmically rather than uniformly over time; thus, first-rate findings will occur with decreasing frequency. Scientific progress will not end, but it will observe Rescher's "law of logarithmic retardation."

The virtue of this modeling effort is that it calls attention to some crucial determinants of the rate of scientific progress. In the language of economics, these are (i) the "supply" of potential scientific discoveries inherent in the structure of the natural world, (ii) the technology, or "production function," relating resource inputs to scientific outputs (findings), and (iii) the supply of resource inputs available for scientific inquiry, which depends on, among other things, the rate of growth of the economy as a whole. A principal defect of Rescher's work is that he makes highly restrictive, arbitrary, and empirically unsupported assumptions about the form of these supply and production functions. There are a wide variety of alternative assumptions that would not compel a conclusion of deceleration in scientific progress. Even if one accepts Rescher's unverified assumption about the distribution of potential discoveries, sufficiently rapid improvement in the technology of inquiry may offset for a considerable time any tendency toward deceleration of scientific progress. Rescher cites two examples of research apparatus (telescopes and particle accelerators) where costs have increased more rapidly than performance. But it is not difficult to cite powerful counter-examples, most notably the enormous reduction in the costs of computation. As in economic growth models from Ricardo to Meadows, it is
