Scientific Growth:

Models of Scientific Development and the Case of Nuclear Magnetic Resonance Henk Zandvoort, 2012-12-06 From the nineteen sixties onwards a branch of philosophy of science has come to development called history oriented philosophy of science This development constitutes a reaction on the then prevailing logical empiricist conception of scientific knowledge The latter was increasingly seen as suffering from insurmountable internal problems like e g the problems with the particular observational theoretical distinction on which it drew In addition the logical empiricists general approach was increasingly criticized for two external shortcomings Firstly the examples of scientific knowledge that the logical empiricists were focusing on were considered as too simplistic to be informative on the nature of real life science Secondly it was felt that the attention of these philosophers of science was restricted to the static aspects of scientific knowledge while neglecting its developmental aspects History oriented philosophy of science has taken up the challenge implicit in the latter two criticisms i e to develop accounts of science that would be more adequate for understanding the development of real life science One of the more successful products of this branch of philosophy of science is Lakatos s theory of scientific development sometimes called the methodology of scientific research programmes This theory conceives science as consisting of so called research programmes developing in time and competing with each other over the issue which one generates the best explanations of the phenomena that they address

Karl Popper: Philosophy of science 1 Anthony O'Hear, 2004 Born in Austria Karl Popper 1902 1994 was one of the dominant philosophical thinkers of the 20th century A ground breaking thinker he saw the essence of true science as being the readiness to submit theories to severe testing and to reject them when refuted by test His first major book in 1935 *The Logic of Scientific Discovery* marked him as a major analyst of science and was to have an enormous influence on the way people including major scientists came to think about the field This collection is a timely assessment of the reactions to and abiding influence of Popper's work and the controversy it caused across many academic and political fields The set includes early responses to Popper's work from sources difficult to obtain and also two early reviews by Carnap and Grelling in translations specially prepared for this set It is organised thematically and includes a substantial new introduction by the editor

Philosophy of Science and the Occult Patrick Grim, 1990-07-17 This book both introduces the philosophy of science through examination of the occult and examines the occult rigorously enough to raise central issues in the philosophy of science Placed in the context of the occult philosophy of science issues become immediately understandable and forcefully compelling Divergent views on astrology parapsychology and quantum mechanics mysticism emphasize topics standard to the philosophy of science Such issues as confirmation and selection for testing causality and time explanation and the nature of scientific laws the status of theoretical entities the problem of demarcation theory and observation and science and values are discussed Significantly revised this second edition presents an entirely new section of quantum mechanics and mysticism including instructions from N David Mermin for constructing a device which dramatically illustrates the genuinely puzzling phenomena of quantum mechanics A more complete and current review of research on astrology has been included in this new edition and the section on the problem of demarcation has been broadened

Science and Technology Policy F. Tisdell, 2012-12-06 I was asked recently to prepare an independent background report on the subject of priority assessment in science and technology policy for the Australian Science and Technology Council The Council while not necessarily endorsing this book suggested that a wider audience could be interested in the type of material contained in my report and kindly gave me permission to publish the material in my own right The present book contains this and other material some of which was presented at a seminar on National Science Policy Implications for Government Departments arranged by the Department of Science and the Environment Additional ideas were developed in response to comments on the manuscript by referees as a result of discussions with Professor John Metcalfe and Dr Peter Stubbs of Manchester University a conversation with Dr Keith Hartley of the University of York and in the wake of a communication from Dr Ken Tucker Assistant Director Bureau of Industry Economics Australia Science and technology policy affects and concerns everyone of us if for no other reason than we cannot escape in this interdependent world from the economic social and environmental ills generated

by science and technology We must face the problems and promises inherent in new and existing science and technology whether we like it or not Not surprisingly this book finds that all industrialized countries seem to be facing similar economic and social problems The Local Configuration of New Research Fields Martina Merz,Philippe Sormani,2015-10-27 This new Yearbook addresses the question of how policy place and organization are made to matter for a new research field to emerge Bringing together leading historians sociologists and organizational researchers on science and technology the volume answers this question by offering in depth case studies and comparative perspectives on multiple research fields in their nascent stage including molecular biology and materials science nanotechnology and synthetic biology The Yearbook brings to bear the lessons of constructivist ethnography and the practice turn in Science and Technology Studies STS more broadly on the qualitative comparative and critical inquiry of new research fields In doing so it offers unprecedented insights into the complex interplay of national research policies regional clusters particular research institutions and novel research practices in and for any emerging field of techno science It systematically investigates national and regional differences including the variable mobilization of such differences and probes them for organizational topicality and policy relevance

The Kuhnian Image of Science Moti Mizrahi,2017-12-06 More than 50 years after the publication of Thomas Kuhn s seminal book The Structure of Scientific Revolutions this volume assesses the adequacy of the Kuhnian model in explaining certain aspects of science particularly the social and epistemic aspects of science One argument put forward is that there are no good reasons to accept Kuhn s incommensurability thesis according to which scientific revolutions involve the replacement of theories with conceptually incompatible ones Perhaps therefore it is time for another decisive transformation in the image of science by which we are now possessed Only this time the image of science that needs to be transformed is the Kuhnian one Does the Kuhnian image of science provide an adequate model of scientific practice If we abandon the Kuhnian picture of revolutionary change and incommensurability what consequences would follow from that vis vis our understanding of scientific knowledge as a social endeavour The essays in this collection continue this debate offering a critical examination of the arguments for and against the Kuhnian image of science as well as their implications for our understanding of science as a social and epistemic enterprise **Logic, Methodology and Philosophy of Science VII** R.
