**Seed Dispersal by Ants in a Deciduous Forest Ecosystem** Elena Gorb,Stanislav Gorb,2003-08-31 Countless ants transport and deposit seeds and thereby influence the survival death and evolution of many plant species In higher plants seed dispersal by ants myrmecochory has appeared many times independently in different lineages More than 3000 plant species are known to utilize ant assistance to be planted Myrmecochory is a very interesting and rather enigmatic form of mutualistic ant plant associations This phenomenon is extremely complex because there are hundreds of ant species connected with hundreds of plant species This book effectively combines a thorough approach to investigating morphological and physiological adaptations of plants with elegant field experiments on the behaviour of ants This monograph is a first attempt at collecting information about morphology ecology and phenology of ants and plants from one ecosystem The book gives readers a panoramic view of the hidden poorly known interrelations not only between pairs of ants and plant species but also between species communities in the ecosystem The authors have considered not just one aspect of animal plant relationships but have tried to show them in all their complexity Some aspects of the ant plant interactions described in the book may be of interest to botanists others to zoologists or ecologists but the entire work is an excellent example of the marriage of these biological disciplines

*Ant-Plant Interactions* Paulo S. Oliveira,Suzanne Koptur,2017-08-17 Ants are probably the most dominant insect family on earth and flowering plants have been the dominant plant group on land for more than 100 million years In recent decades human activities have degraded natural environments with unparalleled speed and scale making it increasingly apparent that interspecific interactions vary not only under different ecological conditions and across habitats but also according to

anthropogenic global change This is the first volume entirely devoted to the anthropogenic effects on the interactions between these two major components of terrestrial ecosystems A first rate team of contributors report their research from a variety of temperate and tropical ecosystems worldwide including South Central and North America Africa Japan Polynesia Indonesia and Australia It provides an in depth summary of the current understanding for researchers already acquainted with insect plant interactions yet is written at a level to offer a window into the ecology of ant plant interactions for the mostly uninitiated international scientific community

**Insect Ecology** Timothy D. Schowalter, 2016-07-29 Insect Ecology An Ecosystem Approach Fourth Edition follows a hierarchical organization that begins with relatively easy to understand chapters on adaptive responses of insect populations to various environmental changes disturbances and anthropogenic activities how insects find food and habitat resources and how insects allocate available energy and nutrients Chapters build on fundamental information to show how insect populations respond to changing environmental conditions including spatial and temporal distribution of food and habitat The next section integrates populations of interacting species within communities and how these interactions determine structure of communities over time and space Other works in insect ecology stop there essentially limiting presentation of insect ecology to evolutionary responses of insects to their environment including the activities of other species The unique aspect of this book is its four chapters on ecosystem structure and function and how herbivores pollinators seed predators and detritivores drive ecosystem dynamics and contribute to ecosystem stability Provides the most advanced synthesis of insect ecology with updated material throughout and new chapters Presents the roles of insects in delivery of ecosystem services and applications to pest management and conservation Features full coverage of ecosystem structure and function balanced with essential background on evolutionary aspects Includes case studies highlighting practical and theoretical applications for topics covered in each chapter

**The Ecology and Evolution of Ant-Plant Interactions** Victor Rico-Gray, Paulo S. Oliveira, 2008-09-15 Ants are probably the most dominant insect group on Earth representing ten to fifteen percent of animal biomass in terrestrial ecosystems Flowering plants meanwhile owe their evolutionary success to an array of interspecific interactions such as pollination seed dispersal and herbivory that have helped to shape their great diversity The Ecology and Evolution of Ant Plant Interactions brings together findings from the scientific literature on the coevolution of ants and plants to provide a better understanding of the unparalleled success of these two remarkable groups of interspecific interactions in general and ultimately of terrestrial biological communities The Ecology and Evolution of Ant Plant Interactions synthesizes the dynamics of ant plant interactions including the sources of variation in their outcomes Victor Rico Gray and Paulo S Oliveira capture both the emerging appreciation of the importance of these interactions within ecosystems and the developing approaches that place studies of these interactions into a broader ecological and evolutionary context The collaboration of two internationally renowned scientists The Ecology and Evolution of Ant Plant Interactions will become a standard reference for understanding
