Applying population-based threshold models to quantify and improve seed quality attributes Prof Kent J. Bradford, Dr Pedro Bello, 2022-07-25 Achieving rapid and uniform stand establishment in crops requires a combination of high quality seeds and appropriate environmental conditions In particular temperature and soil moisture or water potential are the major factors influencing germination in the field In this chapter we focus on the application of population based threshold PBT models to characterize seed germination time courses and how environmental

and technological inputs influence them Viewing seed quality as a product of the behavior of populations of individual seeds is critical for understanding the causes and consequences of poor performance Quantitatively characterizing seed population features enables their use in seed sorting and seed enhancement and provides phenotypes for use in research breeding conservation and restoration We believe that PBT models are essential tools to enable full utilization of new advances in seed technology to improve seed quality and enable successful stand establishment in agriculture or in natural settings

Ensuring Food Security Mirza Hasanuzzaman, Muhammad Suleman Tahir, Mohsin Tanveer, Adnan Noor Shah, 2023-12-03 This book provides a comprehensive summary of the recent advances in the biofortification of plants under climate change and how it affects food security globally. The need for mineral biofortification to eradicate or alleviate malnutrition through sustainable agriculture is also discussed. Biofortification of edible plants is considered the most appropriate approach to alleviate nutritional problems and nutrient deficiencies. In contrast, biofortification focuses on improving the nutritional content of the region's current agricultural biodiversity while preserving its habits and customs. Emphasis is also placed on recent advances and developments in omics, particularly metabolomics and related techniques to unravel the potential alterations in plants caused by biofortification. The book brings together eminent scientists to present the latest developments in the field. This timely publication addresses practical scenarios of bio-fortified food production and climate change. The book focuses on the methods, techniques, and environmental changes used to enhance and improve agricultural products. This book is one of the first to provide information on the use of modern biotechnologies to modify crops for health benefits. It also examines the mechanisms of the plant responses to genetically induced biofortification, the production and responses of fortified plants under climate change, and their effects on food security. The book will be useful for students and researchers, especially crop scientists, environmental scientists, biotechnologists, botanists, and agronomists, to understand the techniques and mechanisms of biofortification and responses of biofortified plants under climate change.
