Seibergwitten Theory And The Integrable Systems:

    Seiberg-witten Theory And The Integrable Systems Andrei Marshakov,1999-03-26 In the past few decades many attempts have been made to search for a consistent formulation of quantum field theory beyond perturbation theory One of the most interesting examples is the Seiberg Witten ansatz for the N 2 SUSY supersymmetric Yang Mills gauge theories in four dimensions The aim of this book is to present in a clear form the main ideas of the relation between the exact solutions to the supersymmetric SUSY Yang Mills theories and integrable systems This relation is a beautiful example of reformulation of close to realistic physical theory in terms widely known in mathematical physics systems of integrable nonlinear differential equations and their algebro geometric solutions First the book reviews what is known about the physical problem the construction of low energy effective actions for the N 2 Yang Mills theories from the traditional viewpoint of quantum field theory Then the necessary background information from the theory of integrable systems is presented In particular the author considers the definition of the algebro geometric solutions to integrable systems in terms of complex curves or Riemann surfaces and the generating meromorphic 1 form These definitions are illustrated in detail on the basic example of the periodic Toda chain Several toy model examples of string theory solutions where the structures of integrable systems appear are briefly discussed Then the author proceeds to the Seiberg Witten solutions and show that they are indeed defined by the same data as finite gap solutions to integrable systems The complete formulation requires the introduction of certain deformations of the finite gap solutions described in terms of quasiclassical or Whitham hierarchies The explicit differential equations and direct computations of the prepotential of the effective theory are presented and compared when possible with the well known computations from supersymmetric quantum gauge theories Finally the book discusses the properties of the exact solutions to SUSY Yang Mills theories and their relation to integrable systems in the general context of the modern approach to nonperturbative string or M theory   Seiberg-Witten Theory and Integrable Systems Andrei Marshakov,1999 In the past few decades many attempts have been made to search for a consistent formulation of quantum field theory beyond perturbation theory One of the most interesting examples is the Seiberg Witten ansatz for the N 2 SUSY supersymmetric Yang Mills gauge theories in four dimensions The aim of this book is to present in a clear form the main ideas of the relation between the exact solutions to the supersymmetric SUSY Yang Mills theories and integrable systems This relation is a beautiful example of reformulation of close to realistic physical theory in terms widely known in mathematical physics systems of integrable nonlinear differential equations and their algebro geometric solutions First the book reviews what is known about the physical problem the construction of low energy effective actions for the N 2 Yang Mills theories from the traditional viewpoint of quantum field theory Then the necessary background information from the theory of integrable systems is presented In particular the author considers the definition of the algebro geometric solutions to integrable systems in terms of complex curves or Riemann surfaces and the generating meromorphic 1 form These

definitions are illustrated in detail on the basic example of the periodic Toda chain Several toy model examples of string theory solutions where the structures of integrable systems appear are briefly discussed Then the author proceeds to the Seiberg Witten solutions and show that they are indeed defined by the same data as finite gap solutions to integrable systems The complete formulation requires the introduction of certain deformations of the finite gap solutions described in terms of quasiclassical or Whitham hierarchies The explicit differential equations and direct computations of the prepotential of the effective theory are presented and compared when possible with the well known computations from supersymmetric quantum gauge theories Finally the book discusses the properties of the exact solutions to SUSY Yang Mills theories and their relation to integrable systems in the general context of the modern approach to nonperturbative string or M theory

Seiberg Witten Gauge Theory Matilde Marcolli,1999-12-15 Instanton Counting, Quantum Geometry and Algebra Taro Kimura,2021-07-05 This book pedagogically describes recent developments in gauge theory in particular four dimensional N 2 supersymmetric gauge theory in relation to various fields in mathematics including algebraic geometry geometric representation theory vertex operator algebras The key concept is the instanton which is a solution to the anti self dual Yang Mills equation in four dimensions In the first part of the book starting with the systematic description of the instanton how to integrate out the instanton moduli space is explained together with the equivariant localization formula It is then illustrated that this formalism is generalized to various situations including quiver and fractional quiver gauge theory supergroup gauge theory The second part of the book is devoted to the algebraic geometric description of supersymmetric gauge theory known as the Seiberg Witten theory together with string M theory point of view Based on its relation to integrable systems how to quantize such a geometric structure via the deformation of gauge theory is addressed The third part of the book focuses on the quantum algebraic structure of supersymmetric gauge theory After introducing the free field realization of gauge theory the underlying infinite dimensional algebraic structure is discussed with emphasis on the connection with representation theory of quiver which leads to the notion of quiver W algebra It is then clarified that such a gauge theory construction of the algebra naturally gives rise to further affinization and elliptic deformation of W algebra

Application of Integrable Systems to Phase Transitions C.B. Wang,2013-07-20 The eigenvalue densities in various matrix models in quantum chromodynamics QCD are ultimately unified in this book by a unified model derived from the integrable systems Many new density models and free energy functions are consequently solved and presented The phase transition models including critical phenomena with fractional power law for the discontinuities of the free energies in the matrix models are systematically classified by means of a clear and rigorous mathematical demonstration The methods here will stimulate new research directions such as the important Seiberg Witten differential in Seiberg Witten theory for solving the mass gap problem in quantum Yang Mills theory The formulations and results will benefit researchers and students in the fields of phase transitions integrable systems matrix models and Seiberg Witten theory Current Algebras on Riemann
