The Mesophase Concept in Composites Pericles S. Theocaris, 2012-12-06 The increasing use of advanced composite materials in modern structures of high performance calls for a detailed knowledge of their properties On the other hand these materials possessing intense anisotropy and in some cases non homogeneity require complicated theories based on homogeneous anisotropic elasticity Typically such materials either involve fiber reinforced composites which are stacked in layers and form laminates or particulate composites containing a second phase in powder form However each case must be separately analyzed in terms of the particular characteristics of the materials involved and the process of preparation of the composite systems Composite materials consisting of more than one distinct phase are in general use in modern industrial applications Machine parts structural components and others may be manufactured from such materials Epoxy resins are suitable matrices for this class of materials This is due not only to their general properties such as linear mechanical behavior transparency etc but also to the possibility of modifying their mechanical and optical properties in a very wide range by using suitable modifiers Their rheological behavior as well as their dynamic properties have been extensively investigated

Metastable States Stephen Z.D. Cheng, 2008-09-10 A classical metastable state possesses a local free energy minimum at infinite sizes but not a global one This concept is phase size independent We have studied a number of experimental results and proposed a new concept that there exists a wide range of metastable states in polymers on different length scales where their metastability is critically determined by the phase size and dimensionality Metastable states are also observed in phase transformations that are kinetically impeded on the pathway to thermodynamic equilibrium This was illustrated in structural and morphological investigations of crystallization and mesophase transitions liquid liquid phase separation vitrification and gel formation as well as combinations of these transformation processes The phase behaviours in polymers are thus dominated by interlinks of metastable states on different length scales This concept successfully explains many experimental observations and provides a new way to connect different aspects of polymer physics Written by a leading scholar and industry expert Presents new and cutting edge material encouraging innovation and future research Connects hot topics and leading research in one concise volume **Environmentally Friendly Polymer Nanocomposites** Suprakas Sinha
