Abstract: Metallic Glasses are considered to be the materials of the future. These new materials are said to be stronger and much springier than the best industrial steel. This article presents a short review of metallic glasses: the general knowledge, the history and methods of preparation of metallic glasses, the remarkable properties along with potential applications and problems exist in studying of these new materials.

Keywords: Glasses, metallic, non-crystalline solid, elastic, strength.

1. INTRODUCTION

Mention "glass", and a window pane comes to mind. To scientists, a glass is any material that can be cooled from a liquid to a solid without crystallizing. Most metals crystallize as they cool, arranging their atoms into a highly regular spatial pattern called a lattice. But if crystallization does not occur, and the atoms settle into a nearly random arrangement, the final form is a metallic glass. Unlike common glasses, such as window glass, which are typically electrical insulators, metallic glasses have good electrical conductivity. With no crystal defects, metallic glasses have a lot of remarkable properties, which promise a lot of applications in engineering. However, study of the structure and study how to create a metallic glass with a large size is a challenge for scientists. Thus, although the first successful fabrication of metallic glasses was done more than 50 years ago, these materials still have a very large attractiveness in science and engineering. The objective of this article is to introduce the general knowledge, the problems have not been resolved and the potential applications of these new materials.

2. HISTORY OF METALLIC GLASSES

How to create a metallic glass? The answer is to give the metal atoms not the slightest chance to form a crystal. This means to cool the material superfast. The formation of the first metallic glass of $\text{Au}_{80}\text{Si}_{20}$ was reported by Duwez and co-workers at the California Institute of Technology in 1960 [1]. Rapidly quenching a $\text{Au}_{80}\text{Si}_{20}$ alloy, using "splat-cooling" to
