PRASADA RAO, 2008-06-20 Designed as a textbook for undergraduate and postgraduate students of agriculture it fulfills the need for an up-to-date comprehensive information as per the syllabus framed by ICAR on the theoretical and applied aspects of agricultural meteorology Illustrated with graphs schematic representations photographs and pictures the scope of the book is divided into three major areas of study 1 Discusses the basic aspects of agricultural meteorology introduces the principal meteorological variables with emphasis on radiation and temperature that govern the atmosphere and highlights the causal factors leading to the global and local weather and climate variations like atmospheric pressure and winds clouds monsoon and precipitation 2 Addresses the effects of weather on various crops and discusses applications of Hopkin's bioclimatic law to mitigate the ill effects of weather on crop production explains agroclimatic classification and discusses droughts and their management strategy with special reference to crops 3 Deals with various types of weather forecasting and their techniques including weather service to farmers explains crop growth simulation modelling a newly emerging area in agricultural meteorology focuses on influence of weather in relation to pest and disease outbreaks discusses climate change and provides introduction to remote sensing A special feature of the book is that it contains many indigenous examples related to the humid tropics In addition the book has many plates and information on basic and sophisticated meteorological equipment A variety of chapter end questions help develop students understanding of salient concepts and makes the material presented more meaningful **Instructions in the Use of Meteorological Instruments** Robert Henry Scott, 1877 **Revue Hydrographique**, 1924 Ecology, Environmental Science and Conservation 2nd Edition JS Singh | SP Singh | SR Gupta | Rishikesh Singh, The updated second edition of the book offers an innovative synthesis of fundamental ecological concepts and practical applications in environmental science and conservation

It is the first textbook on the subject by eminent Indian researchers and presents most of the examples from the Indian subcontinent. The book covers a wide range of topics including fundamental concepts required to comprehend the physical environment, population dynamics, community characteristics, patterns and gradients in biodiversity, ecosystem functioning and dynamics, and the study of biogeography. It also addresses applied topics such as environmental pollution impact assessment, natural resource management, biodiversity conservation, ecosystem services, global climate change, ecosystem restoration, urban ecology, and sustainable development. The main issues are discussed within the sustainability framework, considering humans as part of ecosystems and recognising that sustainable development requires the integration of ecology with social sciences for policy formulation and implementation. The updated edition of the book aligns with the National Education Policy 2020 and the revised UGC Guidelines. It aims to meet the needs of students in basic and multidisciplinary courses in ecology and environmental science as well as professionals in agriculture, forestry, and geography at both the graduate and postgraduate levels.

Atmosphere, Ocean and Climate Dynamics John Marshall, R. Alan Plumb, 1963-01-01

For advanced undergraduate and beginning graduate students in atmospheric, oceanic, and climate science. *Atmosphere, Ocean and Climate Dynamics* is an introductory textbook on the circulations of the atmosphere and ocean and their interaction with an emphasis on global scales. It will give students a good grasp of what the atmosphere and oceans look like on the large scale and why they look that way. The role of the oceans in climate and paleoclimate is also discussed. The combination of observations, theory, and accompanying illustrative laboratory experiments sets this text apart by making it accessible to students with no prior training in meteorology or oceanography. Written at a mathematical level that is appealing for undergraduates and beginning graduate students. Provides a useful educational tool through a combination of observations and laboratory demonstrations which can be viewed over the web. Contains instructions on how to reproduce the simple but informative laboratory experiments. Includes copious problems with sample answers to help students learn the material.

Singh, 2010-02-17 Water is vital for life. Since the dawn of civilization, much effort has been made to harness sources of fresh water. Recent years have raised global awareness of the need for increasing demand of water worldwide, largely because of growing population, rising standard of living, higher demand for energy, and greater appreciation for environmental quality. As an example, the world population has increased threefold in the past five decades. In order to meet the rising water demand, water resources are being developed by building large dams, reservoirs, barrages, and weirs across rivers worldwide. The guiding principle for water resources development has been to ensure adequate supply of water for agriculture, domestic use, including fine drinking water, waste disposal, industries, and energy production with due attention to maintain the ecosystem.

functions This development however depends on a holistic cooperative and scientific approach The basic inputs in the assessment of waterresources for a given region are from hydrological data and the subject of hydrology forms the core in achieving sustainable development of water resources Barring a few exceptions hydrological data for most river basins are sparse and therefore it is difficult to comprehensively assess their water resources The major source of water is rainfall which occurs as a result of condensation of atmospheric moisture governed by the science of meteorology
