Studies of the S-Adenosylmethionine-Dependent Methyltransferases Yi Peng, 2009 S adenosylmethionine dependent methyltransferases AdoMet dependent MTases are a main subfamily of MTases which play critical roles in diverse methylation reactions in many significant biological processes AdoMet dependent MTases catalyze methylation reactions utilizing the methyl donor AdoMet This thesis describes structure function studies of several members of this enzyme family which are biomedically important By combining experimental X ray crystallography and theoretical molecular dynamics simulation calculations structural biology techniques with molecular biology and functional studies the work presented here provides molecular insight into mechanisms of enzyme function and drug response The first enzyme studied thiopurine S methyltransferase TPMT modulates the cytotoxic effects of thiopurine prodrugs such as 6 mercaptopurine 6MP by methylating them in a reaction using AdoMet as the donor Patients with TPMT variant allozymes exhibit diminished levels of protein and or enzyme activity and are at risk for thiopurine drug induced toxicity We have determined two crystal structures of wild type murine TPMT as a binary complex with the product S adenosyl L homocysteine AdoHcy and as a ternary complex with AdoHcy and the substrate 6MP to 1.8 and 2.0 resolution respectively Comparison of the structures reveals that an active site loop becomes ordered upon 6MP binding The positions of the two ligands are consistent with the expected SN2 reaction mechanism Arg147 and Arg221 the only polar amino acids near 6MP are highlighted as possible participants in substrate deprotonation Structure based mutagenesis and enzyme activity assays suggest that either Arg152 or Arg226 may participate in some fashion in the TPMT reaction with one residue compensating when the other is altered and that Arg152 may interact with substrate more directly than Arg226 consistent with observations in the murine TPMT crystal structure In addition we have compared the catalytic activity of wild type and 5 variant TPMTs and found that the variant s binding affinity for its methyl acceptor and donor substrates are reduced 10 fold and 2 fold contributing to decreased enzyme activity of murine TPMT 5 We have determined two crystal structures of murine TPMT 5 as a binary complex with AdoHcy and as a ternary complex with AdoHcy and 6MP respectively The TPMT 5 crystal structures together with molecular dynamics simulation calculations reveal that the active site loop is more flexible in TPMT 5 which affects the AdoMet and 6MP substrate affinity and results in loss of the enzyme activity In addition these TPMT 5 crystal structures and the computational modeling of other TPMT variants using wild type murine TPMT structures aid our understanding of the molecular consequences of TPMT polymorphisms Furthermore crystal structures of TPMT complexes with benzoic acid inhibitors and thiophenol substrate reveal that TPMT possesses a flexible active site which can accommodate both a smaller acceptor substrate such as thiophenol and larger benzoic acid inhibitors These structures provide insights into the connection between the subtle variation in binding of different acceptor substrate site ligands to TPMT and the different degree of inhibition by these benzoic acid inhibitors The structural features of the acceptor binding site characterized by the ensemble of TPMT structures reported here may be useful in identifying new small molecule modulators for optimization of thiopurine

based therapy Nicotinamide N methyltransferase NNMT catalyzes the N methylation of nicotinamide pyridines and other structural analogs using AdoMet as methyl donor The crystal structure of human NNMT which plays a significant role in the regulation of metabolic pathways and cancers was solved as the ternary complex bound to both AdoHcy and nicotinamide The structure reveals the structural basis for nicotinamide binding highlights several residues in the active site which may play roles in nicotinamide recognition and NNMT catalysis and provides a structural basis for the design of NNMT mutants to further investigate the enzyme s catalytic mechanism The structure based mutagenesis of NNMT is being pursued in ongoing studies Arsenic methyltransferase AS3MT is the third important AdoMet dependent MTase included in our studies It is involved in methylation of inorganic arsenic and relevant to public health To obtain the crystal structure of AS3MT for elucidation of the mechanism of arsenic methylation and to probe the relationship between AS3MT polymorphisms and individual variation in arsenic metabolism a number of AS3MT constructs have been prepared and characterized and efforts to crystallize AS3MT are ongoing

Red Blood Cell Aging Antonio De Flora, Mauro Magnani, 2013-03-08 The mammalian erythrocyte is a very suitable model for the study of aging at the cellular and molecular level It is not only a matter of apparent simplicity in terms of biochemistry biophysics and physiology but more likely this cell offers a great possibility for elucidating some basic problems in the process of aging In fact nowadays it is possible to follow individual cells all along their life span in circulation it is possible to obtain these cells when young middle aged or old and it is possible to obtain cells from individuals of defined ages and transfuse them into compatible recipients to investigate the role of the environment where the cell lives and finally it is possible to easily manipulate the red cell content in terms of enzymatic activities and or metabolic properties to investigate the possible effect of these manipulations on cell survival This book Red Blood Cell Aging is based on a symposium held in Urbino Italy at the end of 1990 and examines the impact of age on the membrane metabolism structural and enzymatic proteins of mammalian erythrocytes The various contributions to this symposium not only described those processes of aging which affect the cell but also provided a nearly complete picture of the event s and mechanism s that every day permits to recognize among 25 trillion circulating red cells in an average adult that 1 percent that have reached the end of their 120 day life span in circulation

Secondary Metabolism in Microorganisms, Plants and Animals M. Luckner,2013-12-11 Many of the reactions and compounds involved in metabolism are almost identical in the different groups of living organisms They are known as primary metabolic reactions and primary metabolic products In addition however a wide variety of biochemical pathways are characteristic of only a few species of organisms of single chemical races or even of a certain stage of differentiation of specialized cells Such pathways are collectively referred to as secondary metabolism and the compounds formed are called secondary products Secondary products are frequently revealed by their color smell or taste They are responsible for the flavor of most foodstuffs and beverages and for the color and fragrance of flowers and fruits Many of them are part of the materia medica e g alkaloids cardiac glycosides antibiotics or compounds acting as hormones Others are used by industry e g rubber tannins and cellulose This book treats the organization and significance of biosynthesis storage transformation and degradation of the most important groups of secondary products in microorganisms plants and animals It shows that the

formation of secondary products is a common characteristic of specialized cells brought about by the action of special enzymes encoded by specific genetic material. It demonstrates that the biosynthesis of secondary products is typically without significance for the individual producer cell but may play a decisive role in the development and function of the producer organism as a whole.
